DISTRIBUTION STATEMENT A. Approved for public release; distribution is unlimited.
DOE STANDARD

HOISTING AND RIGGING
(Formerly Hoisting and Rigging Manual)

Summary of Changes as of March 1999

U.S. Department of Energy
Washington, D.C. 20585

AREA SAFT
Introduction

The U.S. Department of Energy (DOE) *Hoisting and Rigging Standard* is intended as a reference document to be used by supervisors, line managers, safety personnel, equipment operators, and any other personnel responsible for safety of hoisting and rigging operations at DOE sites. The standard quotes verbatim or paraphrases (with minor editorial changes for consistency) the requirements of the U.S. Occupational Safety and Health Administration (OSHA) and the American National Standards Institute (ANSI). It also encompasses, under one cover, hoisting and rigging requirements, codes, standards, and regulations, eliminating the need to maintain extensive (and often incomplete) libraries of hoisting and rigging standards throughout DOE.

As indicated in the History and Background section, the use of the imperative voice (as in “Never use discarded load chain for slings”) or the word “shall” denotes a mandatory action, whereas use of the word “should” denotes a recommended action in keeping with best management practices.

From chapter to chapter, the reader may notice what appears to be excessive repetition. Such repetition, however, is by design, enabling the use of each chapter, if needed or convenient, as a stand-alone document.

The standard occasionally goes beyond the minimum general industry standards established by OSHA and ANSI; and also delineates the more stringent requirements necessary to accomplish the extremely complex, diversified, critical, and oftentimes hazardous hoisting and rigging work found within the DOE complex. In doing so, it addresses the following items which are not covered in detail in the general industry standards:

1. Management responsibility and accountability
2. Operator/inspector training and qualification requirements
3. Definition of critical lifts and the additional requirements for making them
4. The need and responsibilities of a person-in-charge for critical lifts
5. The need and responsibilities of a designated leader for ordinary lifts
6. The definition and special requirements for preengineered production lifts
7. Special requirements for the testing, inspection, and maintenance of hoisting equipment in hostile environments
8. Nondestructive testing/nondestructive examination requirements for such items as hooks, welds, and spreader bars
9. Special requirements for inspection and load-testing of hoisting and rigging equipment/accessories
10. Hook latch requirements for cranes, slings, and rigging accessories
11. Design standards for such equipment as cranes, forklifts, and hooks
12. Operating practices for hoisting and rigging operations
13. Rigging information and load tables

14. Good and bad rigging practices.

Because the possibility of serious accidents resulting in personnel injury or death or significant property damage exists whenever hoisting and rigging take place, the requirements for these operations must be clearly defined and precautions ensured, including proper preplanning, extreme care, attention to detail, teamwork on the part of trained operators/riggers, and the use of equipment that is reliable, properly designed, inspected, and maintained. Although not mandatory at all DOE sites and locations, this standard has been used for many years by DOE and its contractors as a valuable resource for conducting hoisting and rigging safely and efficiently and as the standard against which to judge all hoisting and rigging programs. The full implementation of the requirements and recommendations of this standard will dramatically strengthen hoisting and rigging programs throughout the DOE complex and will significantly decrease the probability of serious accidents resulting in personnel injury or death or severe property damage.

When organizations operating under nuclear energy programs are required to use DOE document NE F8-6T, those organizations shall use a combination of it and The DOE Hoisting and Rigging Standard. Where conflicts exist, this standard shall be given priority since it is being kept current and NE F8-6T has not been revised since 1985.

To propose improvements to the standard, please use the copy of the form at the back. All requests or suggestions for improvement should be submitted to:

Hoisting and Rigging Project Manager
U.S. Department of Energy

Germantown, MD  20874-1290

CHAPTER 1 TERMINOLOGY AND DEFINITIONS

CRANE: A machine used for lifting and lowering a load vertically and moving it horizontally and that has a hoisting mechanism as an integral part of it.

CRANES, TYPES OF:

**Automatic Crane:** A crane that, when activated, operates through a preset cycle or cycles.

**Cab-Operated Crane:** A crane controlled by an operator in a cab located on the bridge or trolley.

**Cantilever Gantry Crane:** A gantry or semigantry crane in which the bridge girders or trusses extend transversely beyond the crane runway on one or both sides.

**Floor-Operated Crane:** A crane whose operation is controlled by use of a pendant in the hands of an operator on the floor or on an independent platform.

**Gantry Crane:** A crane similar to an overhead crane, except that the bridge for carrying the trolley or
trolleys is rigidly supported on two or more legs running on fixed rails or other runway.

**Jib Crane:** A fixed crane with a vertical rotating member supported at the bottom (also at the top in some types) from which an arm extends to carry the hoist trolley. Jib cranes are most commonly mounted on a vertical column, supplied as part of the jib crane, or on existing structural members (e.g., a wall-mounted jib crane).

**Mobile Crane:** For the purposes of this chapter, mobile cranes are defined as wheel-mounted cranes, truck cranes, and crawler cranes.

**Note:** Figures 15-1 through 15-10 are located in Chapter 15 “Construction Hoisting and Rigging Equipment Requirements”

- **A wheel-mounted crane** consists of a rotating structure with power plant, operating machinery, and boom, mounted on a base or platform equipped with axles and rubber-tired wheels for travel. The base is usually propelled by an engine in the superstructure, but it may be equipped with a separate engine controlled from the superstructure (see Figures 15-1, 15-3, 15-5, 15-6, 15-7, 15-9, and 15-10).

- **A truck-mounted crane** consists of a rotating superstructure with power plant that operates machinery and boom, mounted on an automotive truck equipped with a power plant for travel. Commercial truck-mounted cranes are included in this category (see Figures 15-3, 15-7, 15-9, and 15-10).

- **A crawler crane** consists of a rotating superstructure with power plant, operating machinery and boom, mounted on a base equipped with crawler treads for travel (see Figures 15-2 and 15-8).

**Overhead Traveling Crane:** A crane with a movable bridge carrying a movable or fixed hoisting mechanism and traveling on an overhead fixed-runway structure.

**Power-Operated Crane:** A crane whose mechanism is driven by electricity, air, hydraulics, or internal combustion.

**Pulpit-Operated Crane:** A crane operated from a fixed operator station that is not attached to the crane.

**Remote-Operated Crane:** A crane controlled by an operator not in a pulpit or a cab attached to the crane, by any method other than pendant or rope control (e.g., radio-controlled crane).

**Semigantry Crane:** A gantry crane with one end of the bridge rigidly supported on one or more legs that run on a fixed rail or runway, the other end of the bridge being supported by a truck running on an elevated rail or runway.

**Wall-Mounted Crane:** A crane having a jib, with or without a trolley, supported from a side wall or line of columns of a building. It is a traveling-type crane and operates on a runway attached to the side wall or line of columns.

**Wall-Mounted Jib Crane:** See Cranes, Types Of, Jib Crane.
CRITICAL DIAMETER: Diameter of the smallest bend for a given wire rope that permits the wires and strands to adjust themselves by relative movement while remaining in their normal positions.

PRECISION LOAD POSITIONING DEVICES: A rigging accessory designed specifically to precisely raise and lower a load through a limited range of lifting/lowering motion (stroke). Standards units typically have 12 in. (30 cm) stroke and can position a load within 0.001 in. (0.025 mm). These devices commonly include a built-in load scale and in such cases may also serve as a load-indicating device.

CHAPTER 2 CRITICAL LIFTS

2.2 Critical-Lift Requirements

f. The procedure and rigging sketches shall be reviewed and approved by the responsible manager (or designee) and the responsible oversite organization (such as safety, quality assurance, or quality control) before the lift is made.

g. A pre-lift meeting involving participating personnel shall be conducted prior to making a critical lift. The critical lift plan/procedure shall be reviewed and questions shall be resolved.

h. If required by the critical lift procedure, a practice lift shall be done before the critical lift. Conditions for a practice lift should closely simulate actual conditions involving: weight, rigging selection and configuration, load movement path, and other relevant factors. Practice lifts should be done by the same crew, using the same lifting equipment.

CHAPTER 4 LIFTING PERSONNEL

4.1 General

a. These special procedures shall be followed when lifting personnel:

23. After the personnel platform is positioned, all brakes and locks on the lift crane shall be set before personnel perform any work.

24. No lifts shall be made on another of the crane’s load lines while personnel are suspended on a platform.

CHAPTER 6 PERSONNEL QUALIFICATIONS AND TRAINING

6.3.4 Forklift Truck Operators

a. Only qualified and authorized operators shall be permitted to operate powered forklift trucks. Operator trainees may operate powered forklift trucks under the direct supervision of a qualified operator or trainer and only where such operations does not endanger the trainee or other employees.
DOE-STD-1090-99 Summary of Changes

b. The initial training of operators shall include:

1. A combination of formal instruction (e.g., lecture, discussion, interactive computer learning, video tape, written material).

2. Practical training (demonstrations performed by the trainer and practical exercises performed by the trainee).

3. Evaluation of the operator’s performance in the workplace including results of written and oral evaluation, and witnessing a demonstration of the operator's skills.

c. The following checklist contains basic factors with which a forklift truck operator should be familiar. This checklist must be tailored to suit actual conditions.

1. Operating instruction, warnings, and precautions for the type of forklift truck the operator will be authorized to operate.

2. Differences between the forklift truck and the automobile.

3. Forklift truck controls and instrumentation:
   i. Where they are located.
   ii. What they do.
   iii. How they work.

4. Engine or motor operation.

5. Steering and maneuvering.

6. Visibility, including restrictions due to loading.

7. Fork and attachment adaptation, operation, and use limitations.

8. Forklift truck capacity and load weight determination.

10. Forklift truck inspections and maintenance that the operator will be required to perform.

11. Refueling and/or charging and recharging of batteries.

12. Operating limitations.

13. Any other operating instructions, warning, or precautions listed in the operator’s manual for the type of forklift truck that the employee is being trained to operate.

14. Traveling with and without a load.
15. Lifting personnel.
17. Lessons learned.
19. Applicable standards and regulations.
22. Terminology and definitions.
23. Records and documents.
24. Operating practices.
25. Fire protection.

d. Refresher training in relevant topics shall be provided to the operator when:
   1. The operator has been observed to operate the forklift truck in an unsafe manner.
   2. The operator has been involved in an accident or near-miss incident.
   3. The operator has received an evaluation that reveals that the operator is not operating the forklift truck safely.
   4. The operator is assigned to drive a different type of forklift truck.
   5. A condition in the workplace changes in a manner that could affect the safe operation of the forklift truck.

**CHAPTER 7 OVERHEAD AND GANTRY CRANES**

**7.2.1 General**

a. There shall be no apparent damage, excessive wear, or deformation of any load-bearing part of the equipment. Brakes shall work satisfactorily and load brakes shall be designed to hold any load up to at least 125 percent of the rated stable capacity of the equipment without slipping or overheating. All safety devices, load indicators, controls, and other operating parts of the equipment shall be checked during each inspection and shall be in good working order. Parts found to be defective during any inspection or nondestructive examination shall be replaced or repaired as directed by the responsible line manager or that person's designated representative.
b. Frequency notation as used in dates for frequent and periodic inspections should be defined as follows:

1. Daily—24 hours.
2. Weekly—7 days.
3. Monthly—31 days.
4. Quarterly—92 days.
5. Semi-annually—184 days.
6. Yearly—365 days.

e. Violations of inspection periods may be granted on a case-by-case basis, provided there is a pre-established site-specific policy.

7.2.3 Initial Inspection

Prior to their initial use, all new, reinstalled, modified, or extensively repaired cranes shall be inspected by a qualified inspector to ensure compliance with applicable provisions of this chapter. Inspections of repaired and modified cranes may be limited to the provisions affected by the alteration, repair, or modification as determined by a qualified person. Dated and signed inspection reports shall be kept on file and shall be readily available.

7.3.1 Operational Tests

a. Prior to initial use, all new, reinstalled, extensively repaired, or modified cranes shall be tested by a designated person to ensure compliance with this chapter, including the following functions:

1. Lifting and lowering.
2. Trolley travel.
3. Bridge travel.
4. Locking, limiting, and indicating devices, if provided.
5. Limit switches/devices.

7.3.2 Rated Load Test

a. Prior to initial use, all new or reinstalled cranes and cranes in which the load sustaining parts have been altered, modified, repaired, or replaced, or whose rated capacities have been affected shall be tested by or under the direction of a qualified inspector. A designated or authorized person shall determine if repairs made to a crane are extensive, requiring a rated load test, or routine maintenance requiring only operational testing. The replacement of rope is excluded from this requirement. However, a functional test of the crane under a normal operating load should be made prior to putting the crane back in service. A written report shall be furnished by the inspector confirming the load rating of the crane. The load rating should
not be more than 80 percent of the maximum load sustained during the test.

b. The rated load test for new cranes shall consist of the following operations as minimum requirements:

e. Extensively repaired or modified cranes shall be tested in accordance with paragraph 7.3.2.b above insofar as interfering equipment/structures permit and in accordance with recommendations from the manufacturer or a responsible engineering organization.

b. A written report confirming the rated load testing of the crane shall be furnished by the inspector.

c. Test loads shall not be less than 100% or more than 125 percent of the rated capacity, unless otherwise recommended by the manufacturer or a qualified person.

d. Testing shall consist of the following operations as minimum requirements:

1. Hoist the test load a sufficient distance to ensure that the load is supported by the crane and held by the hoist brakes. Personnel shall be kept clear of the test load while it is suspended.

2. Transport the test load by means of the trolley for the full length of the bridge.

3. Transport the test load by means of the bridge for the full length of the runway, in one direction with the trolley as close to the extreme right-hand end of the crane as practical, and in the other direction with the trolley as close to the extreme left-hand end of the crane as practical.

4. Lower the test load, stopping by the brakes.

e. The replacement of load chain and rope is specifically excluded from this requirement; however, an operational test of the crane shall be made in accordance with para. 7.3.1.a.1 prior to putting the crane back in service.

f. If wire rope clips or wedge socket end connection are installed during wire rope installation:

1. The crane should be cycled several times with a load equal to or greater than the maximum operational load, normally 100% of the rated capacity.

2. If wire rope clips are used, then check and retighten nuts to the wire rope clip or wire rope manufacturer’s recommended torque value.

3. If a wedge socket is used, then verify that the rope is properly seated.

g. Operational testing of altered, repaired, or modified cranes whose load sustaining parts or rated capacities have not been affected may be limited to the functions affected by the alteration, repair, or modification as determined by a qualified person.

h. The transporting of test loads as required by paragraphs 7.3.1.a or 7.3.2.a above, shall be done insofar as interfering equipment/structures permit and in accordance with recommendations from the manufacturer or a responsible engineering organization. However, test loads should not be carried over critical systems or components.

i. Test weights shall be accurate to within -5 percent, +10 percent of stipulated values.

Changes - 8
7.4.2 Wire-Rope Maintenance

Personnel using wire rope shall ensure proper care by doing the following:

a. Store rope to prevent damage or deterioration.

b. Unreel or uncoil rope as recommended by the rope manufacturer and with care to avoid kinking or inducing a twist.

c. Before cutting rope, use some method to prevent unlaying the strands. Flame cutting wire rope is prohibited. Heat affected zones of flame cut wire rope shall not be allowed to bear load.

d. During installation, avoid dragging the rope in dirt or around objects that will scrape, nick, crush, or induce sharp bends in it.

EXHIBIT I (continued) Page 2 of 4

BRIDGE CRANE AND FOLLOW UP CHECKS

NOTES:
1. Craftsmen shall initial all steps completed below.
2. Qualified inspector shall verify all steps below.
3. Load test shall be performed on all new, extensively repaired, or modified cranes prior to initial use.
4. Load test crane at 125% of rated capacity. In no case shall the load test exceed 125% of rated capacity. Test weights shall be accurate to -5%, + 0% of stipulated values.

CHAPTER 8 HOIST

8.2.1 General

a. Frequency notation as used in dates for frequent and periodic inspections should be defined as follows:

— 1. Daily—24 hours.
— 2. Weekly—7 days.
— 4. Quarterly—92 days.
— 5. Semi-annually—184 days.
— 6. Yearly—365 days.

b. Violations of inspection periods may be granted on a case by case basis, provided there is a pre-established site specific policy.
8.2.2 Initial Inspection

Prior to their initial use, all new, extensively repaired, or modified hoists shall be inspected by a qualified inspector to ensure compliance with the applicable provisions of ASME B30.11, B30.16, and B30.21. Dated and signed inspection records shall be kept on file and shall be readily available.

8.3.1 Operational Tests

All new hoists shall be tested by the hoist manufacturer. All modified or extensively repaired hoists or hoists that have not been used within the preceding 12 months shall be tested before being placed in service. All tests shall be done by a qualified inspector or under the direction of that inspector as detailed in the following paragraphs.

8.3.2 Proof-Load Test

Test anchorages or suspensions shall be approved by a qualified person.

8.3.2.1 Electric- or Air-Powered Hoists

a. The manufacturer shall dynamically test new hoists as specified in Section 8.3.1.1 (“Electric- or Air-Powered Hoists”), steps a. and b., with a test load of at least 125 percent of the rated load. If the manufacturer cannot test the hoist, the user shall be notified and the test shall be accomplished at another location or job site by a qualified inspector or under the direction of that inspector.

b. A qualified inspector shall test hoists in which load suspension parts have been modified, replaced, or extensively repaired as specified in Section 8.3.1.1, steps a. and b. by or under the direction of a qualified inspector, and a record of the test should be made. A designated or authorized person shall determine if repairs made to a hoist are extensive, and require a rated load test, or routine maintenance and require only an operational test. The applied test load shall not be less than 100 percent of the rated capacity of the hoist, or more than 125 percent of the rated capacity of the hoist unless otherwise recommended by the manufacturer or a qualified person. The replacement of load chain and rope is specifically excluded from this hoist test; however, a functional test of the hoist under a normal operating load should be made in accordance with 8.3.1., “Operational Tests,” prior to putting the hoist back in service.

8.3.2.2 Hand-Chain-Operated or Manual-Lever-Operated Hoists

a. The manufacturer shall dynamically test new hoists with a test load of at least 125 percent of the rated capacity. If the manufacturer cannot test the hoist, the user shall be notified and the test shall be accomplished at another location or job site by a qualified inspector or under the direction of that inspector.

b. Hoists in which load suspension parts have been modified, replaced, or extensively repaired shall be tested statically or dynamically by or under the direction of a qualified inspector, and a record of the test should be kept. A designated or authorized person shall determine if repairs made to a hoist are extensive and require a rated load test or are routine maintenance and require only an operational test. The applied test load shall not be less than 100 percent of the rated capacity of the hoist or more than 125 percent of the rated capacity of the hoist, unless otherwise recommended by the manufacturer or a qualified person. The replacement of load chain is specifically excluded from this hoist load test; however, a functional test of the hoist should be made in accordance with Section 8.3.1.2 or 8.3.1.3 (“Hand-Chain-Operated Hoists” and
“Manually Lever-Operated Hoists,” respectively), prior to putting the hoist back in service.

CHAPTER 9 MOBILE CRANES

9.1.7 Counterweight

a. Cranes shall not be operated without the ballast or counterweight being in place as specified by the crane manufacturer. Under specific conditions, such as during crane assembly, unusual boom configurations, etc. the crane manufacturer’s recommendations for the amount of ballast or counterweight shall be adhered to.

b. Ballast or counterweight as specified by the manufacturer shall not be exceeded.

9.2.1 General

a. Equipment shall operate with a smooth, regular motion without any hesitation, abnormal vibration, binding, gross shimmy, or irregularity. There shall be no apparent damage, excessive wear, or deformation of any load-bearing part of the equipment. All safety devices, load indicators, boom angle and radius indicators, controls, and other operating parts of the equipment shall be checked during each inspection and shall be in good working order.

b. Frequency notations as used in dates for frequent and periodic inspections should be defined as follows:

   — 1. Daily—24 hours.
   — 2. Weekly—7 days.
   — 4. Quarterly—92 days.
   — 5. Semi-annually—184 days.
   — 6. Yearly—365 days.

e. Violations of inspection periods may be granted on a case by case basis, provided there is a pre-established site specific policy.

9.4.3 Wire-Rope Maintenance

Personnel using wire rope shall ensure proper care by doing the following:

a. Store rope to prevent damage or deterioration.

b. Unreel or uncoil rope as recommended by the rope manufacturer and with care to avoid kinking or inducing a twist.
c. Before cutting a rope, place seizing on each side of the place where the rope is to be cut. Use some method to prevent unlaying the strands. Flame-cutting wire rope is prohibited. Heat-affected zones of flame cut wire rope shall not be allowed to bear load.

d. During installation, avoid dragging the rope in the dirt or around objects which will scrape, nick, crush, or induce sharp bends in it.

9.5.1 Conduct of Operator

r. Use power lowering when lowering loads. When lowering heavy loads, keep the hoist brake as reserve. Use a safety pawl on the boom-hoist drum when not lowering.

s. Avoid two-blocking, caused when the hook block makes contact with boom-point sheaves. A continuing pull on the hoist lines can break the rope or pull the boom back over the cab on some types of booms. On hydraulically telescoping booms, be sure to play out the hoist line when extending and spool in the hoist line when retracting.

t. Lock carrier air brakes ON when operating, and check the pressure of the air brakes frequently.

u. Watch out for the carrier-cab on truck-mounted units when swinging the boom. Keep boom high enough to swing clear of cab.

v. In the absence of crane manufacturer’s instructions regarding maximum wind speeds for operation, operations undertaken at wind speeds in excess of 25 mph should be evaluated by a qualified person to determine if the size, shape and weight of the load can be safely lifted.

w. When a crane is to be operated at a fixed radius, the boom-hoist pawl or other positive locking device shall be engaged.

x. On truck-mounted cranes, no loads shall be lifted over the front area, except as approved by the crane manufacturer.

y. Crane cabs, necessary clothing and personal belongings shall not interfere with access or operations.

z. Tools, oil cans, waste, extra fuses, and other necessary articles shall be stored in the tool box, and shall not be permitted to lie loose in or about the cab.

9.5.7 Attaching the Load

a. Ensure that the hoist rope is free from kinks or twists. Do not wrap the hoist rope around the load.

b. Ensure that the load is attached to the load-block hook by means of slings or other approved devices.

c. Ensure the load is well secured and properly balanced in the sling or lifting device before it is lifted more than a few inches.

d. Take care to make certain that the sling clears all obstacles.
9.5.8 Moving the Load

e. Avoid carrying loads over people.

f. No hoisting, lowering, swinging, or traveling shall be done while anyone is on the load or hook, except as noted in Chapter 4, “Lifting Personnel.”

g. Test the brakes each time a load approaching the rated capacity is handled by raising the load a few inches and applying the brakes.

h. Do not lower the load below the point where less than two full wraps of rope remain on the hoist drum.

i. Do not leave your position at the controls while the load is suspended, unless required to do so by an approved emergency procedure.

j. If the load must remain suspended for any considerable length of time, the operator shall hold the drum from rotating in the lowering direction by activating the positive controllable means of the operator’s station.

k. Work on suspended loads is prohibited under normal conditions. When the responsible manager decides that it is necessary to work on a suspended load, guidelines for ensuring safety of the work shall be established through consultation with the appropriate safety organization. Suspended loads that must be worked on shall be secured against unwanted movement.

CHAPTER 10 FORKLIFT TRUCKS

Chapter 10 was totally re-written to ensure all applicable requirements of 29 CFR 1910.178 “Powered Industrial Trucks,” ASME B56.1 “Safety Standard for Low Lift and High Lift Trucks” and B56.6 “Safety Standard for Rough Terrain Forklift Trucks” are incorporated.

CHAPTER 11 WIRE ROPE AND SLINGS

11.3.2.2 Proof-Testing

a. All swaged socket and poured socket sling assemblies shall be certified as having been proof-tested. All other sling assemblies shall be proof-tested when specified by the purchaser.

11.2.5 Wire-Rope Maintenance

Personnel using wire rope shall ensure proper care by doing the following:

a. Store rope to prevent damage or deterioration.

b. Unreel or uncoil rope as recommended by the rope manufacturer or a qualified person and with care to avoid kinking or inducing a twist.

c. Before cutting a rope, use some method to prevent unlaying of the strands. Flame cutting wire rope is
prohibited. Heat-affected zones of flame cut wire rope shall not be allowed to bear load.

11.3.2.3 Operations

a. Ordinary Lifts

11. Use protector pads or blocking at sharp corners.

12. Keep hands and fingers out of the area between the sling and the load.

13. Ensure that the weight of the load is within the rated capacity of the sling.

14. Do not use damaged slings.

15. Ensure that all personnel stand clear of the suspended load.

17. In a basket hitch, ensure that the load is balanced to prevent slippage.

18. Avoid handling hot material with wire-rope slings.

11.3.3 Alloy Steel-Chain Slings.

k. The safe-load level of any chain sling is a function of three basic factors: size and number of legs, condition of chain and other components, and sling angle between legs and horizontal. Table 11-10 shows safe loads in pounds per leg which can be carried by various chain-sling arrangements. Note the effect of very low hook height and wide leg spreads.

l. Attachments: Hooks, rings, oblong links, pear shaped links, welded or mechanical coupling links and other attachments shall have a rated capacity at least equal to that of the alloy steel chain with which they are used or the sling shall not be used in excess of the rated capacity of the weakest component.

CHAPTER 12 RIGGING ACCESSORIES

12.4 Eyebolts

a. This section specifies requirements for eyebolts that are used as rigging hardware during normal hoisting and rigging activities. Eyebolts designed for and permanently installed on existing engineered equipment are considered part of the engineered equipment, and they may not meet all requirements specified for rigging hardware. Eyebolts permanently installed on engineered equipment are acceptable for their intended use so long as they pass normal visual inspection before use. It is important to know how the manufacturer or engineered equipment intends permanently installed eyebolts to be used. In some cases the intended use is obvious to an experienced craftsman in other cases engineering review of vendor information may be necessary.

CAUTION: Eyebolts installed by the manufacturer to lift only parts of the engineered equipment are not suitable for lifting the completed piece of equipment. When questions arise regarding the use of
manufactured-installed eyebolts, the equipment custodian or cognizant engineer shall be consulted.

b. Eyebolts used for hoisting shall be fabricated from forged carbon or alloy steel.

c. Eyebolt marking:

1. Carbon Steel Eyebolts shall have the manufacturer’s name or identification marked forged in raised characters on the surface of the eyebolt.

2. Alloy Steel Eyebolts shall have the symbol “A” (denoting alloy steel) and the manufacturer’s name or identification mark forged in raised characters on the surface of the eyebolt.

d. Eyebolts shall have a minimum design factor of 5:1. The vertical safe working load shall be forged, stamped, or inscribed into each eyebolt by the manufacturer or the owner. A permanently attached metal tag bearing the same information may also be used.

### 12.9 Precision Load Positioners

a.. A precision load positioning device in the load path shall have a design factor of no less than 5:1, based on ultimate strength of the device’s load bearing components.

b. A precision load positioner shall be operated, maintained, calibrated and tested in accordance with the manufacturer’s instructions.

c. Prior to initial use, all new, repaired, and altered precision load positioning devices shall be load tested, and a written report shall be furnished, confirming the load rating. If the load test is not performed by the manufacturer, it shall be done under the direction of a designated or authorized person in strict compliance with the manufacturer’s instructions. Special attention should be paid to the manufacturer’s instructions concerning testing of devices equipped with load gages as they may be damaged during the load test.

### CHAPTER 13 LOAD HOOKS

#### 13.2.4 Frequent Inspection

a. Operators or other designated personnel shall visually inspect the hook at the following intervals (records are not required):

1. Normal service—monthly. Operation at less than 85 percent of rated capacity except for isolated instances.

2. Heavy service—weekly to monthly. Operation at 85 to 100 percent of rated capacity as a regular specified procedure.

3. Severe service—daily to weekly. Operation at heavy service coupled with abnormal operating conditions, (i.e., extreme temperatures, corrosive atmospheres, etc.)
CHAPTER 14 BELOW-THE-HOOK LIFTING DEVICES

This chapter provides the requirements for below-the-hook lifting devices used in hoisting and rigging, such as spreader bars, lifting yokes, and lift fixtures. This section implements the requirements of ASME B30.20, “Below-the-Hook Lifting Devices.”

NOTE: Special lifting devices for shipping containers weighing 10,000 lb or more that are used for radioactive materials may be governed by ANSI N14.6 [“Standard for Special Lifting Devices for Shipping Containers Weighing 10,000 Pounds (4,500 kg) or More for Nuclear Materials.”]

14.1 General

a. Special lifting devices for shipping containers weighing 10,000 lb or more that are used for radioactive materials are may be governed by ANSI N14.6 [“Standard for Special Lifting Devices for Shipping Containers Weighing 10,000 Pounds (4,500 kg) or More for Nuclear Materials.”]

a. Below-the-hook lifting devices are arranged in the following groups because of the diversity of types:

1. Structural and mechanical lifting devices.
2. Vacuum lifting devices.

14.2.6 Testing

14.2.6.1 Operational Test

NOTE: Special lifting devices for shipping containers weighing 10,000 lb or more that are used for radioactive materials must be tested in accordance with ANSI N14.6.

a. Modified or repaired lifting devices shall be tested before initial use to ensure compliance with the requirements of this section (test reports kept on file). Testing shall include the following:

CHAPTER 15 CONSTRUCTION EQUIPMENT HOISTING & RIGGING REQUIREMENTS

15.3.2 Qualified Operators of Forklift Trucks

a. Physical qualifications shall be based on specific job requirements.
b. Operators shall be required by the employer to pass a practical operating skill evaluation. Qualification shall be limited to the type of forklift for which the operator is being evaluated.

c. The actual or simulated operation shall enable operators to demonstrate basic knowledge and skills at a level that ensures the safety of personnel and equipment.

d. Only qualified and authorized operators shall be permitted to operate powered forklift trucks. Operator trainees may operate powered forklift trucks under the direct supervision of a qualified operator or trainer and only where such operations does not endanger the trainee or other employees.

e. The initial training of operators shall include:

1. A combination of formal instruction (e.g., lecture, discussion, interactive computer learning, video tape, written material).

2. Practical training (demonstrations performed by the trainer and practical exercises performed by the trainee).

3. Evaluation of the operator’s performance in the workplace including results of written and oral evaluation, and witnessing a demonstration of the operator’s skills.

f. The following checklist contains basic factors with which a forklift truck operator should be familiar. This checklist must be tailored to suit actual conditions.

1. Operating instruction, warnings, and precautions for the type of forklift truck the operator will be authorized to operate.

2. Differences between the forklift truck and the automobile.

3. Forklift truck controls and instrumentation:
   i. Where they are located.
   ii. What they do.
   iii. How they work.

4. Engine or motor operation.

5. Steering and maneuvering.

6. Visibility, including restrictions due to loading.

7. Fork and attachment adaptation, operation, and use limitations.

8. Forklift truck capacity and load weight determination.

10. Forklift truck inspections and maintenance that the operator will be required to perform.
11. Refueling and/or charging and recharging of batteries.

12. Operating limitations.

13. Any other operating instructions, warning, or precautions listed in the operator’s manual for the type of forklift truck that the employee is being trained to operate.

g. Refresher training in relevant topics shall be provided to the operator when:

1. The operator has been observed to operate the forklift truck in an unsafe manner.

2. The operator has been involved in an accident or near-miss incident.

3. The operator has received an evaluation that reveals that the operator is not operating the forklift truck safely.

4. The operator is assigned to drive a different type of forklift truck.

5. A condition in the workplace changes in a manner that could affect the safe operation of the forklift truck.

15.4.1 General

c. Equipment with deficiencies that may affect the safety of the operation shall not be allowed to operate at DOE installations. No repairs, modifications, or additions that affect the capacity or safe operation of the equipment shall be made by the contractor without the manufacturer’s written approval. Where manufacturer’s specifications are not available, the limitations assigned to the equipment shall be based on the determinations of a qualified engineer. Dated and signed records shall be kept on file.

15.4.4 Forklift Trucks—Inspection

a. Prior to initial use, all new, modified, or repaired forklifts shall be inspected by a qualified inspector to ensure compliance with the provisions of this section.

b. A scheduled planned inspection, maintenance, and lubrication program shall be followed; consult the manufacturer’s recommendations.

c. Only trained and authorized personnel shall be permitted to inspect, maintain, repair, and adjust forklift trucks; these services shall be performed in accordance with manufacturer’s specifications. Items listed in the following paragraphs shall be regularly inspected.

8. Attachments shall be included in a scheduled maintenance/inspection program. Inspection steps shall be tailored for the attachment. Load-bearing components shall be examined for deformation and load-bearing welds shall be visually examined for cracks. Mechanical or hydraulic components shall be inspected and maintained in accordance with the manufacturer’s instructions.

9. Attachments shall be inspected not less than annually and the inspection should be documented.

10. Fork inspection shall be carried out by a qualified inspector with the aim of detecting any damage.
failure, deformation, or other condition that might impair safe use. A fork that shows any of the following defects shall be withdrawn from service, and shall not be returned to service until it is satisfactorily repaired by the fork manufacturer or an expert of equal competence. Fork inspection shall include:

i. **Surface Cracks** - A thorough visual examination for cracks and, if considered necessary, non-destructive crack detection, with special attention to the heel and to the welds that attach the mounting components to the fork blank. Inspection for cracks shall include any mounting mechanisms of the fork blank to the fork carrier. Forks shall not be returned to service if surface cracks are detected.

ii. **Fork Tine Inspection** - Examination for straightness of blade and shank, fork angle (upper face of blade to load face of the shank), fork blade and shank wear. Difference in height of fork tips may vary from manufacturer to manufacturer and with tine length. For these reasons, fork tine inspections shall be done in accordance with manufacturers requirements.

iii. **Positioning Lock** - Confirm that the Positioning Lock (when provided), is in good repair and in correct working order. If any fault is found, the fork shall be withdrawn from service until satisfactory repairs are made.

iv. **Fork Hooks Wear** - When fork hooks are provided, the support face of the top hook and the retaining faces of both hooks shall be checked for wear, crushing, and other local deformations.

v. **Fork Marking** - When fork marking is not clearly legible, it shall be renewed. Marking shall be renewed per instructions from the original fork supplier.

### 15.4.5 Forklift Trucks—Testing

Forklift truck load tests are not routinely required.

a. Load tests shall not be conducted until verification that inspection and maintenance is up to date.

b. Load tests shall be performed after major repair or modification to components that affect the load-carrying ability of the truck.

c. The manufacturer should be consulted if questions arise as to whether a load test is appropriate.

d. Forklift trucks shall be load tested by or under the direction of a qualified person and in accordance with the manufacturer's recommendations.

e. Test weights shall be accurate to within -5 percent, +0 percent of stipulated values.

f. Load-test records shall be maintained and shall be made available for examination by the construction management contractor.

g. A load test shall not be conducted in locations such that the lift meets the definition of critical lift in Section 15.2.

h. A fork that has undergone repair, other than repair or replacement of positioning locks or marking, shall be subject to a load test as described in ASME B56.1, Section 7.25, "Forks," Item 3, which lists loading and method of test for forks; except for the test load, which shall correspond to 2.5 times the rated capacity marked on the fork.
Load capacity of an attachment shall be verified by the manufacturer or by a load test at 100% capacity that is performed onsite. Load tests are not routinely required since a catalog cut, user’s manual, decals on attachment, or other manufacturer’s data serves as capacity verification.

15.4.9 Rigging Accessories Testing

a. Tackle assemblies, handling fixtures, and rigging accessories for critical-lift service shall have an initial proof-load test of 2 times the rated capacity. The tackle shall be proof-tested prior to making a critical lift if proof-testing cannot be verified.

b. Tackle assemblies, handling fixtures, and rigging accessories that have been modified or extensively repaired shall be proof-tested again to 2 times the rated capacity prior to making a critical lift.

c. Test loads shall be accurate to within -5 percent, +0 percent of stipulated values.

15.5.2 Mobile Cranes/Boom Trucks

a. Never use signs of tipping to determine if a load is within a crane's capacity. Operating by the “seat of the pants” is an unacceptable practice.

b. Know the rated capacity of the crane. A safe lift depends on boom length, boom angle, and working radius. Follow these suggestions to avoid structural failure or tipping:

1. Know the radius of the load. Remember that the radius is measured from center of rotation, not from the boom foot pins.

2. Always operate within the rated capacity of the machine.

3. Subtract the weight of hooks, blocks, and any other material-handling devices (slings, shackles, spreader bars, etc.) from the gross capacity of the crane to determine if the load can be lifted safely.

4. Load chart ratings are based on operating the machine on firm, level ground. Outriggers shall be fully extended and lowered so that all wheels are clear of the ground, unless otherwise specified on the manufacturer load charts for the crane. Otherwise, “on rubber” load charts shall be used.

5. Avoid rapid changes in velocity while hoisting, swinging, or lowering the load; these can cause overloads when operating at or near the crane's capacity.

6. Do not lift large, heavy loads in strong winds. Wind loading can be critical depending on boom length, boom angle, bulkiness of the load, wind direction, and wind velocity.

7. In the absence of crane manufacturer’s instructions regarding maximum wind speeds for operation, operations undertaken at wind speeds in excess of 25 mph should be evaluated by a qualified person to determine if the size, shape and weight of the load can be safely lifted.

c. Always use the shortest boom possible, and observe these precautions with any boom length:

1. Make only vertical lifts. Never pull the load sideways.

2. Keep speed slow in lifting, lowering, and stopping loads.
3. Do not let the load strike the boom or outriggers and never allow a crane boom to hit or touch any structure. (Boom contact could dent or bend the lower boom chords and may cause a total boom collapse.) Boom contact with any object shall require an engineering evaluation prior to putting the crane back in service. Damage to the crane sustained during operation shall be repaired according to manufacturer’s specifications using certified welders. A reinspection or load test is required after repairs are complete, as is a recertification by the construction management contractor at the subcontractor’s expense indicating that the unit can return to service.

4. Allow maximum clearance between the hook block and boom point sheaves.

5. Keep near-capacity loads as close to the ground as possible.

d. Cranes shall not be operated without the ballast or counterweight being in place as specified by the crane manufacturer. Under specific conditions, such as during crane assembly, unusual boom configurations, etc. the crane manufacturer’s recommendations for the amount of ballast or counterweight shall be adhered to. Ballast or counterweight as specified by the manufacturer shall not be exceeded.

e. Rotate the crane slowly to avoid an outward swing of the load. Attach a tag line to the load to control the swing.

f. Keep the boom high enough to swing clear of the cab when rotating the crane on truck-mounted units.

g. Watch for boom kickback. Never operate with the boom at a higher angle than shown on the capacity chart.

h. Avoid “two-blocking,” which is caused when the hook block collides with boom-point sheaves. Continuous pull on hoist ropes can break the ropes or might pull the boom over the cab. On hydraulically telescoping booms, be sure to play out the hoist rope when extending and reel in the hoist rope when retracting.

i. On truck-mounted cranes, no loads shall be lifted over the front area, except as approved by the crane manufacturer.

15.5.2.6 Critical Lifts

f. The procedure and rigging sketches shall be reviewed and approved by the responsible manager (or designee) and the responsible oversight organization (such as safety, quality assurance, or quality control) before the lift is made.

g. A pre-lift meeting involving participating personnel shall be conducted prior to making a critical lift. The critical lift plan/procedure shall be reviewed and questions shall be resolved.

h. If required by the critical lift procedure, a practice lift shall be done before the critical lift. Conditions for a practice lift should closely simulate actual conditions involving: weight, rigging selection and configuration, load movement path, and other relevant factors. Practice lifts should be done by the same crew, using the same lifting equipment.

15.5.2.7 Lifting Personnel

k. These special procedures shall be followed when lifting personnel:

Changes - 21
17. After the personnel platform is positioned, all brakes and locks on the lift crane shall be set before personnel perform any work.

18. No lifts shall be made on another of the crane’s load lines while personnel are suspended on a platform.

19. Cranes and derricks with variable-angle booms shall be equipped with a boom-angle indicator that is readily visible to the operator.

15.5.3 Forklift Trucks

a. Know the rated capacity of the forklift and always operate within that capacity. Since the load rating for forklifts may be based on stability or hydraulic/structural competence, the rated capacity shall not be exceeded in operational application. Signs of tipping shall never be used to determine if a load is within the forklift’s capacity.

b. Attachments almost always affect rated capacity of the truck. When a forklift truck is equipped with an attachment, the rated capacity of the truck/attachment combination shall be established by the truck manufacturer. Capacity, operation, and maintenance instruction plates, tags, or decals shall be changed accordingly.

1. The rated capacity of an attachment/truck combination shall not be exceeded.

2. On every removable attachment (excluding fork extensions), a corrosion-resistant nameplate with the following information is required:
   
   i. Model number
   
   ii. Serial number on hydraulically actuated attachments
   
   iii. Maximum hydraulic pressure (on hydraulically actuated attachments)
   
   iv. Weight
   
   v. Capacity
   
   vi. The following instructions (or equivalent); "Capacity of truck and attachment combination may be less than capacity shown on attachment. Consult truck nameplate."

   NOTE: The above information should be provided by the attachment manufacturer.

c. Modifications or additions that affect capacity or safe operation shall not be performed without prior written approval from the forklift truck manufacturer. Capacity, operation, and maintenance instruction plates, tags, or decals shall be changed accordingly.

d. Ensure that battery recharging and maintenance takes place in designated areas where smoking, sparks, or open flames are prohibited. Verify the location and operability of eyewash and shower facilities before maintenance is performed. Wear eye protection, rubber gloves, and rubber aprons. Whenever battery maintenance is performed, any area of the body affected by contact with battery electrolyte shall be flushed with water immediately and all acid spills must be cleaned up at once.
15.5.3.1.1 General

a. Safe operation is the responsibility of the operator. Report all accidents and "near misses" promptly.

b. The operator shall develop safe working habits and also be aware of hazardous conditions in order to protect himself, other personnel, the truck, and other material.

c. The operator shall be familiar with the operation and function of all controls and instruments before operating the truck.

d. Before operating any truck, the operator shall be familiar with unusual operating conditions which may require additional safety precautions or special operating instructions.

e. Be certain the truck has successfully passed a pre-use inspection. A sample Pre-operational inspection checklist is included as Exhibit 1, which appears at the end of this chapter.

f. Do not start or operate the truck, any of its functions or attachments, from any place other than from the designated operator’s position.

g. Keep hands and feet inside the operator’s designated area or compartment. Do not put any part of the body outside the operator compartment of the truck.

h. Never put any part of the body within the reach mechanism of the truck or other attachments.

i. Avoid reaching through the mast for any purpose.

j. To safeguard pedestrians, understand the truck’s limitations and observe the following precautions:

   1. Do not drive a truck up to anyone standing in front of an object.

   2. Ensure that personnel stand clear of the rear swing area before conducting turning maneuvers.

   3. Exercise particular care at cross aisles, doorways, and other locations where pedestrians may step into the path of travel of the truck.

   4. Do not allow anyone to stand or pass under the elevated portion of any truck, whether empty or loaded.

k. Do not permit passengers to ride on powered industrial trucks unless a safe place to ride has been provided by the manufacturer.

l. Ensure that fire aisles, access to stairways, and fire equipments is kept clear.

m. A powered industrial truck is considered unattended when the operator is more than 25 ft. (7.6m) from the truck, which remains in his view, or whenever the operator leaves the truck and it is not in his view.

n. Before leaving the operator’s position the operator shall perform the following:

   1. Bring truck to a complete stop.
2. Place directional controls in neutral.

3. Apply the parking brake.

4. Fully lower load-engaging means, unless supporting an elevated platform.

o. In addition, when leaving the truck unattended the operator shall perform the following:
   1. Stop the engine or turn off the controls.
   2. If the truck must be left on an incline, block the wheels.
   3. Fully lower the load-engaging means.

p. Maintain a safe distance from the edge of ramps, platforms, and other similar working surfaces. Do not move railroad cars with a powered industrial truck.

q. Do not use a truck for operating or closing railroad car doors except as follows:
   1. Unless the truck utilizes a device specifically designed for opening and closing railroad car doors and the operator is trained in its use.
   2. The design of the door-opening device shall require the truck to travel parallel to the railroad car, with the force applied in a direction parallel with the door travel.
   3. Care should be exercised when engaging the railroad car door with the door opening device, in order to prevent damage to the doors and/or fork truck by heavy impact forces.
   4. The entire door opening operation shall be in full view of the operator.
   5. The fork truck shall always be positioned to safeguard the dock attendant while removing the door lock pin.
   6. Whenever a railroad car door requires an abnormal force to open, the truck operator shall report the condition to his supervisor.

r. Wheel stops, hand brakes, or other recognized positive protection shall be provided to prevent railroad cars from moving during loading or unloading operations.

s. Consider both the truck and load weight when operating in railcars and semitrailers.

t. Inspect floors on trucks, boxcars, unfamiliar ramps, or platforms before start of operation.

u. Other workers should not be inside the truck when the forklift truck is performing loading or unloading operations. Load arrangements and spacing issues should be determined before the forklift enters the truck.

v. Fixed jacks or supports may be needed to prevent upending or corner dipping when powered industrial trucks are driven on and off semitrailers that are not coupled to the tractor.

w. The brakes of highway trucks shall be set and wheel chocks placed under the rear wheels to prevent the
trucks from rolling while they are boarded.

x. Care shall be taken to not contact overhead installations such as lights, wiring, pipes, sprinkler systems, etc. If in doubt, measure.

y. Motorized hand trucks shall not be ridden unless they are of the hand/rider design.

5.5.3.1.2 Traveling

a. Observe all traffic regulations and under all travel conditions, operate the truck at a speed that will permit it to be brought to a stop in a safe manner. Unless facility-specific procedures state otherwise, the guideline is: within plant buildings - 5 mph; on plant roads - 15 mph. Drive slowly around curves.

b. Yield the right of way to pedestrians and emergency vehicles. Whenever possible, establish eye contact with approaching pedestrians or vehicle drivers before continuing.

c. Do not pass another truck traveling in the same direction at intersections, blind spots, or at other locations where vision is obstructed.

d. Slow down and sound horn at cross aisles and other locations where vision is obstructed.

e. Railroad tracks shall be crossed diagonally whenever possible.

f. Never travel with forks raised to unnecessary heights. Approximately 4 to 6 inches (10 to 15 cm) above floor level is adequate.

g. Do not park closer than 6 ft (1800 mm) to the nearest rail or a railroad track.

h. Face in the direction of travel, except if the load being carried obstructs forward view. In such cases travel with the load trailing.

i. When ascending or descending grades, ramps, and inclines:

1. In excess of 5 percent grade, drive loaded rider trucks with the load upgrade.

3. Use low gear or slowest speed control.

4. Operate unloaded trucks with the load-engaging means downgrade.

5. The load and load-engaging means shall be tilted back, if applicable and raised only as far as necessary to clear the road surface.

6. Avoid turning if possible, and normally travel straight up and down.

j. While turning, be cautious of rear end swing and keep clear of the edge of loading docks.

k. Make starts, stops, turns, or direction reversals in a smooth manner so as not to shift load and/or overturn the truck.

l. Do not indulge in stunt driving or horseplay.
m. Slow down for wet and slippery floors.

n. Before driving over a dockboard or bridge plate, be sure that it is properly secured.

o. Drive carefully and slowly across the dockboard or bridge plate, and never exceed its rated capacity.

p. Do not drive trucks onto any elevator unless specifically authorized to do so. In cases operation are authorized:
   1. Do not exceed the capacity of the elevator:
   2. Approach elevators slowly, and then enter squarely after the elevator car is properly leveled.
   3. Once on the elevator, neutralize the controls, shut off the power, and set brakes.
   4. It is advisable that all other personnel leave the elevator before truck is allowed to enter or leave.

q. Unless a towing hitch is supplied by the manufacturer, do not use forklift trucks as tow trucks. When a towing hitch is provided, use tow bars rather than wire rope for towing.

r. At the end of the operator's shift, return the forklift truck to its assigned parking place, set brakes, fully lower load-engaging means, place controls in neutral position, turn ignition off, and secure the key.

s. If the truck is equipped with a seat belt, use it.

15.5.3.1.3 Loading

a. Since the load rating for forklifts may be based on stability or hydraulic or structural competence, do not exceed the rated capacity in operational application.

b. The designated person shall ensure that the weight of a load approaching the rated capacity (combination of weight and location of the center of gravity) has been determined within -10 percent, +0 percent before it is lifted.

c. Only stable, safely arranged loads shall be handled. Block and secure them if necessary.

d. Caution shall be exercised when handling off-center loads which cannot be centered.

e. Always spread the forks to suit the load width.

f. Extra caution is required when handling loads exceeding the dimensions used to establish truck capacity. Stability and maneuverability may be adversely affected.

g. The forks shall be placed under the load as far as possible; the mast shall be carefully tilted backward to stabilize the load.

h. Do not transport loads or miscellaneous items within the operator’s compartment or other areas of the truck, unless a secure area has been provided and designated by the user.

i. A load backrest extension shall be used whenever necessary to minimize the possibility of the load or
part of it from falling rearward.

j. Do not attach or operate any attachment on a forklift truck that has not been approved for use by the forklift truck manufacturer.

k. When attachments are used, extra care shall be taken in securing, manipulating, positioning, and transporting the load.

l. Operate trucks equipped with attachments as partially loaded trucks when not handling a load.

m. Fork length should be at least two thirds of the load length.

n. Use extreme care when tilting load forward or backward, particularly when high tiering.

o. Do not tilt forward with forks elevated except to pick up or deposit a load over a rack or stack.

p. When stacking or tiering, use only enough backward tilt to stabilize the load.

q. Do not rig loads from the tines of a forklift truck, (attaching rigging to the forks to support a suspended load) without written management approval.

r. Never lift with one fork without an engineering analysis and approval.

s. Use guides and signalers as necessary. If in doubt, check the conditions personally before proceeding. Standard hand signals are shown in Figure 15.17 "Hand Signals."

t. Do not block fire extinguishers, fire protection sprinklers, or alarm stations when stacking loads.

15.5.3.4 Lifting of Personnel

If a work platform is used on forklift trucks designed and intended for handling materials, take the following precautions:

a. Use a lift platform manufactured for the purpose of lifting personnel with a forklift truck. The platform shall include:

1. A 4-in. (10-cm) minimum height toe plate provided on the work platform.

2. The floor of the platform located not more than 8-in (20-cm) above the upper face of the supporting truck fork blade.

3. A restraining means such as a guard rail having a height above the platform floor of not less than 36 in. (90-cm) or more than 42 in. (110-cm) around its upper periphery and including a midrail.

4. An access opening in the guard rail maybe hinged or removable, or chains may be used if proper positioning is easily accomplished and a secured condition is discernible.

5. Guard rails and access openings shall be capable of withstanding a concentrated force of 200 lb (91 kg) in any direction.
6. Means to securely attach the platform to the lifting carriage or forks in such a manner that it cannot slide or bounce off the forks.

7. Means to correctly locate the platform centered laterally on the truck.

8. Floor dimensions that neither exceed two times the load center distance listed on the truck nameplate, measured parallel to the longitudinal center plane of the truck, nor have a width greater than the overall width of the truck (measured across the load bearing tires) plus 10 in. (25-cm) on either side.

9. The following information should be prominently indicated on the platform:
   
   i. maximum load including personnel and equipment;
   ii. weight of empty platform;
   iii. minimum capacity of the truck on which the platform can be used.

b. The combined weight of the platform, load, and personnel shall not exceed one-half of the capacity as indicated on the nameplate of the truck on which the platform is used.

c. Whenever a truck (except for high-lift order-picker trucks) is equipped with vertical hoisting controls elevateable with the lifting carriage or forks, take the following additional precautions to protect personnel:

   1. Means shall be provided whereby personnel on the platform can shut off power to the truck.
   2. Means shall be provided to render inoperative all operating controls on the elevating platform, when the controls on the elevating platform have been selected for use; only one location of controls shall be capable of being operated at one time.
   3. Emergency-lowering means available at ground level should be provided; such means shall be protected against misuse.

d. Take the following precautions whenever personnel are elevated with a forklift truck:

   1. Ensure the truck has a firm and level footing.
   2. Place all travel controls in neutral and set parking brake.
   3. Before elevating personnel, mark area with cones or other devices to warn of work by elevated personnel.
   4. Lift and lower personnel smoothly, with caution, and only at their request.
   5. Avoid overhead obstructions and electric wires.
   6. Keep hands and feet clear of controls other than those in use.
   7. Move truck and/or platform slowly, only for minor adjustments in horizontal positioning when personnel are on the platform, and only at their request.
   8. Ensure the mast is vertical - do not operate on a side slope.
9. The platform is horizontal and never tilted forward or rearward when elevated.

10. Personnel are to remain on the platform floor. The use of railings, planks, ladders, etc., on the platform for the purpose of achieving additional reach or height is prohibited.

11. Ensure personnel and equipment on the platform do not exceed the available space.

12. Lower platform to floor level for personnel to enter and exit. Do not climb on any part of the truck in attempting to enter or exit.

13. The operator shall remain in the control position of the forklift truck.

14. Be certain that the lifting mechanism is operating smoothly throughout its entire lift height, both empty and loaded, and that lift limiting devices and latches, if provided, are functional.

15. Means shall be provided to protect personnel from moving parts of the forklift truck that present a hazard when the personnel platform is in the normal working position.

16. Overhead protection, as necessary for operating conditions, shall be provided.

17. Do not transport personnel from one location to another while they are on the work platform.

18. When not in the operating position, engage the parking brake and block the wheels.

19. Be certain that required restraining means such as railings, chains, cable, body belts with lanyards, or deceleration devices, etc., are in place and properly used.

CHAPTER 16 REFERENCES

APPENDIX A PROCUREMENT GUIDELINES
History and Background

In 1975, cognizant safety and health personnel at the U.S. Department of Energy (DOE) Headquarters (HQ) met to discuss the need for a DOE hoisting and rigging manual. At that meeting, existing, applicable hoisting and rigging codes, standards, and regulations, such as the Occupational Safety and Health Administration (OSHA) 29 CFR 1910, the American National Standards Institute (ANSI) B-30 series, and others, were reviewed in detail. Subsequently, it was determined that these documents, while adequate as minimum general industry standards, did not contain the detail necessary to adequately accomplish the extremely complex, critical, and hazardous hoisting and rigging operations being performed at DOE sites, in all probability, at other government agency and private sectors throughout the country. Because of the high potential for accidents that could result in significant property loss or serious personnel injury or death, it was decided that a DOE hoisting and rigging manual was not only desirable but absolutely necessary.

Preliminary work on the manual was initiated in 1976. The manual that was developed at that time incorporated the minimum requirements of OSHA, ANSI, and similar documents and also included additional more stringent requirements deemed necessary to adequately control hoisting and rigging work processes throughout DOE. Each phase of the manual was then critically reviewed by DOE and contractor personnel. A final draft was completed in 1978 and implemented on a trial basis.

In June 1980, a decision was made to formally issue and distribute the manual under controlled distribution, an arrangement where the manual must be specifically requested from the originating source; however, once requested, updates are automatically received through an actively maintained distribution list. In 1982, the manual was included as a reference standard in DOE 5480.4, “Environmental Protection, Safety, and Health Protection Standards.” Updates and improvements have been made over the years on an approximately annual basis. Revisions have occurred in 1984, 1985, 1986, 1988, 1989, 1993, 1995, and 1996 to clarify intent, comply with OSHA and ANSI B-30 changes, improve format, strengthen wording, delete needless redundancy, eliminate obsolescence, and the like. Prior to inclusion in the manual, all changes must be approved by the DOE Hoisting and Rigging Committee, which meets semi-annually, and by the Headquarters Office of Occupational Safety and Health Policy, which has safety responsibility for DOE hoisting and rigging. The Committee is also a major source for input into the manual, particularly concerning those areas that are not defined or are only generally defined by Federal and national standards, such as training and qualification, and those concerning the DOE’s unique operational environment, such as hoisting and rigging over nuclear reactors and other locations containing critical equipment. In the years that minor revisions occur, only the changed pages, usually 8 to 10, are sent to individuals on the distribution list. After two to three such supplements, the manual is reissued in its entirety, which incorporates the previous supplements plus the most recent unpublished changes approved by the committee. An example is the complete revision issued in 1993 followed by another complete revision in 1995, without any intervening supplements. In this case, the supplements were omitted because of the numerous improvements incorporated within the very short time period. Some of the most notable changes in the current standard include:

1. Full compliance with OSHA and ANSI requirements, with the OSHA requirements having priority where conflicts exist.

2. Expansion of Chapter 6 to include greater detail on qualifications for a larger number of positions. Criteria to be evaluated in training programs have likewise been expanded, enabling sites to tailor training programs to their particular characteristics.

3. The complete reformatting of each section into major equipment categories so that the handbook is easier to use.

4. The use of double-column format along with a slightly larger font size which improves readability. The double-column format has the added advantage of placing figures and tables closer to their referencing text.

History and Background - 1
5. Labeling of the side-by-side good practice, bad practice drawings so that the information being conveyed is immediately apparent. Also, in some cases portions of drawings containing key information, such as hand signals, finger positions were difficult to discern. These have been retouched.

6. This document contains many common element requirements which differ slightly in wording when applied to a specific equipment type. These differences have been compared, and whenever appropriate, the most comprehensive (and clearest) wording has been used.

7. To improve readability, the writing style has been changed to the active voice, which reduces, to some extent, the use of the word “shall,” indicating a mandatory requirement. The reader should note that the use of the active (imperative) voice, such as “ensure that, check for, use only,” indicates a mandatory requirement even if the word “shall” is not present in the sentence.

8. The reissued June ’95 edition marked a change in classification. The DOE Office of Scientific and Technical Information (OSTI) reclassified the manual as a handbook and was issued as DOE Hoisting and Rigging Handbook (DOE-HDBK-1090-95). After further review, OSTI has reclassified the handbook as a DOE Technical Standard and the September 1996 edition is now issued as DOE STANDARD HOISTING AND RIGGING (Formerly Hoisting and Rigging Manual), DOE-STD-1090-96 (Rev-1).

While *The Hoisting and Rigging Standard* is in itself a best practice document, much of its content, such as the OSHA, ANSI/ASME, and Crane Manufacturers Association of America standards, is mandatory within DOE. In addition, many DOE organizations have, on their own initiative, adopted the standard as mandatory to ensure safe and proper hoisting and rigging operations at their facilities. Whether mandatory or not, the standard is and will continue to be the standard by which the excellence of DOE hoisting and rigging programs are judged.
Acknowledgment

The Department of Energy (DOE) acknowledges the many organizations whose documents provided important source material for the standard. They include:

American Society of Mechanical Engineers

ANSI B30.2, “Overhead and Gantry Cranes (Top Running Bridge, Multiple Girder)”

ANSI B30.5, “Crawler, Locomotive, and Truck Cranes”

ANSI B30.9, “Slings”

ANSI B30.10, “Hooks”

ANSI B30.16, “Overhead Hoists (Underhung)”

ANSI B56.1, “Low Lift and High Lift Trucks”

ANSI MH11.4, “Forks and Fork Carriers for Powered Industrial Fork Lift Trucks”

Construction Safety Association (CSA) of Ontario

"The Rigging Handbook"

Society of Automotive Engineers, Inc. (SAE)

SAE J1028, "Mobile Crane Working Area Definitions"

Permission to reprint specific figures and illustrations was obtained from CSA and SAE. Applicable sections of 29 CFR 1910, "Occupational Safety and Health Standards for General Industry," and 29 CFR 1926, "Occupational Safety and Health Regulations for Construction," have been paraphrased or reproduced verbatim throughout. The contributions of DOE’s Hoisting and Rigging Committee, which has met semi-annually since 1980, is also recognized. Representing many DOE sites, this group has provided advice and clarification of the codes and standards that form the underlying basis for this document. Without their time and talent, which has been provided gratuitously, there would be no standard.

Other significant contributors include the two editors, Ingeborg Westfall and Marshall Henrie, whose considerable efforts resulted in several of the substantive improvements described in the History and Background section, and whose changes regarding text, format, and spelling have improved the standard to what we believe is the equivalent of desktop-publishing quality and in doing so increased its usefulness to the hoisting and rigging community. The Department is also greatly indebted to Kay Johnson, now retired, who, during his 10-year tenure as program coordinator, perhaps more than any other person, was responsible for developing the standard into the truly invaluable document that it is today.

The standard is a safety, not a design, document intended for use by safety professionals and managers. In keeping with this philosophy, only those portions of standards and regulations dealing with safety, particularly those deemed most relevant to DOE operations, have been included. While it is convenient to have focused, indepth hoisting and rigging safety information concentrated into one document, the significance of the above source material is acknowledged, and readers are strongly encouraged to review each of them so as to have a full description of the subject area covered.

In the past, DOE issued and disseminated the Hoisting and Rigging Standard using controlled distribution list. Beginning with this edition, uncontrolled distribution is available through the
DOE-STD-1090-99

ES&H Technical Information Services, U.S. Department of Energy, (800) 473-4375, fax: (301) 903-9823 to Federal agencies and their contractors; and the National Technical Information Service, U.S. Department of Commerce, 5285 Port Royal Road, Springfield, VA 22161, telephone (703) 605-6000, to non-Federal agencies, and the private sector. These organizations charge a fee for a copy of the document. DOE appreciates the opportunity to share *The Hoisting and Rigging Standard* with a wider audience.
Introduction

The U.S. Department of Energy (DOE) Hoisting and Rigging Standard is intended as a reference document to be used by supervisors, line managers, safety personnel, equipment operators, and any other personnel responsible for safety of hoisting and rigging operations at DOE sites. The standard quotes verbatim or paraphrases (with minor editorial changes for consistency) the requirements of the U.S. Occupational Safety and Health Administration (OSHA) and the American National Standards Institute (ANSI). It also encompasses, under one cover, hoisting and rigging requirements, codes, standards, and regulations, eliminating the need to maintain extensive (and often incomplete) libraries of hoisting and rigging standards throughout DOE.

As indicated in the History and Background section, the use of the imperative voice (as in “Never use discarded load chain for slings”) or the word “shall” denotes a mandatory action, whereas use of the word “should” denotes a recommended action in keeping with best management practices.

From chapter to chapter, the reader may notice what appears to be excessive repetition. Such repetition, however, is by design, enabling the use of each chapter, if needed or convenient, as a stand-alone document.

The standard occasionally goes beyond the minimum general industry standards established by OSHA and ANSI; and also delineates the more stringent requirements necessary to accomplish the extremely complex, diversified, critical, and oftentimes hazardous hoisting and rigging work found within the DOE complex. In doing so, it addresses the following items which are not covered in detail in the general industry standards:

1. Management responsibility and accountability
2. Operator/inspector training and qualification requirements
3. Definition of critical lifts and the additional requirements for making them
4. The need and responsibilities of a person-in-charge for critical lifts
5. The need and responsibilities of a designated leader for ordinary lifts
6. The definition and special requirements for preengineered production lifts
7. Special requirements for the testing, inspection, and maintenance of hoisting equipment in hostile environments
8. Nondestructive testing/nondestructive examination requirements for such items as hooks, welds, and spreader bars
9. Special requirements for inspection and load-testing of hoisting and rigging equipment/accessories
10. Hook latch requirements for cranes, slings, and rigging accessories
11. Design standards for such equipment as cranes, forklifts, and hooks
12. Operating practices for hoisting and rigging operations
13. Rigging information and load tables
14. Good and bad rigging practices.
Because the possibility of serious accidents resulting in personnel injury or death or significant property damage exists whenever hoisting and rigging take place, the requirements for these operations must be clearly defined and precautions ensured, including proper preplanning, extreme care, attention to detail, teamwork on the part of trained operators/riggers, and the use of equipment that is reliable, properly designed, inspected, and maintained. Although not mandatory at all DOE sites and locations, this standard has been used for many years by DOE and its contractors as a valuable resource for conducting hoisting and rigging safely and efficiently and as the standard against which to judge all hoisting and rigging programs. The full implementation of the requirements and recommendations of this standard will dramatically strengthen hoisting and rigging programs throughout the DOE complex and will significantly decrease the probability of serious accidents resulting in personnel injury or death or severe property damage.

To propose improvements to the standard, please use the copy of the form at the back. All requests or suggestions for improvement should be submitted to:

CHAPTER 1
TERMINOLOGY AND DEFINITIONS

The following are specialized terms commonly used when discussing hoisting and rigging operations. Many may not be used in this standard but are included for general information. The terms are arranged in alphabetical order. Illustrations are included for clarity.

**ABRASION:** Surface wear.

**ACCELERATION STRESS:** Additional stress imposed due to increasing load velocity.

**ALTERNATE LAY:** Lay of wire rope in which the strands are alternately regular and lang lay.

**ANSI:** American National Standards Institute.

**APPOINTED:** Assigned specific responsibilities by the employer or the employer's representative.

**AREA, METALLIC:** Sum of the cross-sectional areas of individual wires in a wire rope or strand.

**ATTACHMENT:** A device other than conventional forks or load backrest extension, mounted permanently or removably on the elevating mechanism of a truck for handling the load. Popular types are fork extension clamps, rotating devices, side shifters, load stabilizers, rams, and booms.

**AUTHORIZED:** Assigned by a duly constituted administrative or regulatory authority.

**AUXILIARY HOIST:** Supplemental hoisting unit of lighter capacity and usually higher speed than the main hoist.

**BACK STAY:** Guy used to support a boom or mast or that section of a main cable, as on a suspension bridge, or cableway, and the like, leading from the tower to the anchorage.

**BAIL:** A U-shaped member of a bucket, socket, or other fitting.

**BASKET OR SOCKET:** The conical portion of a socket into which a splayed rope end is inserted and secured with zinc.

**BATTERY-ELECTRIC TRUCK:** An electric truck in which the power source is a storage battery.

**BECKET LOOP:** A loop of small rope or a strand of rope fastened to the end of a large wire rope to facilitate installation.

**BENDING STRESS:** Stress on wires of a wire rope imposed by bending. This stress need not be added to direct load stresses. When sheaves and drums are of suitable size, bending stress does not affect the normal life of the wire rope.

**BIRDCAGE:** A colloquialism describing the appearance of a wire rope that is forced into compression. The outer strands form a “cage” and at times displace the core.

**BIRDCAGING:** The twisting of fiber or wire rope in an isolated area in the opposite direction of the rope lay, causing it to take on the appearance of a birdcage.

**BOOM (CRANE):** A member hinged to the rotating superstructure and used for supporting the hoisting tackle.

**BOOM LINE:** A wire rope for supporting or operating the boom on derricks, cranes, draglines, shovels, and the like.

**BRAKE:** A device used for slowing or stopping motion by friction or electromagnetic means.

**BRAKE, DRAG:** A brake that provides stopping force without external control.

**BRAKE, HOLDING:** A brake that sets automatically and that prevents motion when power is off.

**BRAKE, PARKING:** A device to prevent the movement of a stationary vehicle.

**BRAKING, COUNTER TORQUE:** A method of stopping motion in which the power to the motor is reversed to develop torque in the opposite direction.

**BRAKING, DYNAMIC:** A method of controlling crane motor speeds when in the
overhauling condition to provide a retarding force.

**BRAKING, MECHANICAL**: A method of slowing motion by friction.

**BRAKING, REGENERATIVE**: A form of dynamic braking in which the electrical energy generated is fed back into the power system.

**BREAKING STRENGTH**: The measured load required to break a wire rope or chain.

**BRIDGE**: The part of a crane, consisting of girders, walkways, railings, trucks, and drive mechanisms, that carries the trolley or trolleys.

**BRIDGE TRAVEL**: Horizontal travel of the crane parallel with runway rails.

**BRIDLE SLING**: A sling composed of multiple legs (branches), the top ends of which terminate in a fitting that latches onto the lifting hook.

**BULL RING**: The main large ring of a sling to which sling legs are attached.

**BUMPER (BUFFER)**: An energy-absorbing device for reducing impact when a moving overhead crane or trolley reaches the end of its permitted travel, or when two moving cranes or trolleys come into contact.

**CAB**: The operator's compartment.

**CABLE**: A term loosely applied to wire ropes, wire strands, manila ropes, and electrical conductors.

**CABLE-LAID WIRE ROPE**: A type of wire rope consisting of several independent wire ropes laid into a single wire rope.

**CABLE CROWD ROPE**: A wire rope used to force the bucket of a power shovel into the material being handled.

**CANTILEVER TRUCK**: A self-loading counterbalanced or noncounterbalanced truck equipped with cantilever load-engaging means, such as forks (see Figure 10-3).

**CARRIAGE**: A support structure for forks or attachments, generally roller-mounted, traveling vertically within the mast of a cantilever truck.

**CENTER**: A single wire or fiber in the center of a strand around which the wires are laid.

**CENTER CONTROL**: The position near the center of a truck cab from which the operator controls movement of the truck.

**CHOKER ROPE**: A short wire-rod sling used to form a slip noose around the object to be moved or lifted (see Figure 1-1).

![Figure 1-1. Choker rope.](image)

**CIRCUMFERENCE**: Measured perimeter of a circle circumscribing the wires of a strand or the strands of a wire rope.

**CLAMP, STRAND**: A fitting used to form a loop at the end of a length of strand; consists of two grooved plates and bolts.

**CLEARANCE**: The distance by which one object clears another, or the clear space between them.

**CLEVIS**: A U-shaped fitting with pins.

**CLIP**: A fitting used to clamp two parts of wire rope.

**CLOSED SOCKET**: A wire-rope fitting consisting of an integral becket and bail.

**CLOSING LINE**: Wire rope that closes a clamshell or orange-peel bucket and then operates as a hoisting rope.

**COIL**: Circular bundle of wire rope not packed on a reel.

**COLLECTOR**: Contacting device mounted on a bridge or trolley and used to collect current from the conductor system.

**COME-ALONG**: A portable, hand-operated device consisting of a housing, a length of chain or wire rope, two hooks, and a ratcheting lever, that is used for miscellaneous pulling.
CONDUCTOR: Wire, angles, bars, tees, or special sections mounted to transmit current to the collectors.

CONICAL DRUM: Grooved hoisting drum of varying diameter.

CONSTRUCTION (WIRE ROPE): Refers to the design of wire rope, including number of strands, number of wires per strand, and arrangement of wires in each strand.

CONTINUOUS BEND: Reeling of wire rope over sheaves and drums so that it bends in one direction (as opposed to reverse bend).

CONTROLLER: An operator's device for regulating the power delivered to a motor or other equipment.

CONTROLLER, SPRING RETURN: A controller that, when released, will return automatically to a neutral position.

CORE: The center member of a wire rope around which the strands are laid. It may be fiber, a wire strand, or an independent wire rope.

CORING LINE: Wire rope used to operate the coring tool for taking core samples during the drilling of a well.

CORROSION: Chemical decomposition by exposure to moisture, acids, alkalies, or other destructive agents.

CORRUGATED: A term used to describe the grooves of a sheave or drum when worn so as to show the impression of a wire rope.

COUNTERBALANCED TRUCK: A truck equipped with load-engaging means wherein, during normal transporting, all the load is external to the polygon formed by the wheel contacts (see Figure 10-3).

COVER WIRES: The outer layer of wires.

CRANE: A machine used for lifting and lowering a load vertically and moving it horizontally and that has a hoisting mechanism as an integral part of it.

CRANES, TYPES OF:

Automatic Crane: A crane that, when activated, operates through a preset cycle or cycles.

Cab-Operated Crane: A crane controlled by an operator in a cab located on the bridge or trolley.

Cantilever Gantry Crane: A gantry or semigantry crane in which the bridge girders or trusses extend transversely beyond the crane runway on one or both sides.

Floor-Operated Crane: A crane whose operation is controlled by use of a pendant in the hands of an operator on the floor or on an independent platform.

Gantry Crane: A crane similar to an overhead crane, except that the bridge for carrying the trolley or trolleys is rigidly supported on two or more legs running on fixed rails or other runway.

Jib Crane: A fixed crane with a vertical rotating member supported at the bottom (also at the top in some types) from which an arm extends to carry the hoist trolley. Jib cranes are most commonly mounted on a vertical column, supplied as part of the jib crane, or on existing structural members (e.g., a wall-mounted jib crane).

Mobile Crane: For the purposes of this chapter, mobile cranes are defined as wheel-mounted cranes, truck cranes, and crawler cranes.

- A wheel-mounted crane consists of a rotating structure with power plant, operating machinery, and boom, mounted on a base or platform equipped with axles and rubber-tired wheels for travel. The base is usually propelled by an engine in the superstructure, but it may be equipped with a separate engine controlled from the superstructure (see Figures 15-1, 15-3, 15-5, 15-6, 15-7, 15-9, and 15-10).

- A truck-mounted crane consists of a rotating superstructure with power plant that operates machinery and boom, mounted on an automotive truck equipped with a power plant for travel. Commercial truck-mounted cranes are included in this category (see Figures 15-3, 15-7, 15-9, and 15-10).
A **crawler crane** consists of a rotating superstructure with power plant, operating machinery and boom, mounted on a base equipped with crawler treads for travel (see Figures 15-2 and 15-8).

**Overhead Traveling Crane:** A crane with a movable bridge carrying a movable or fixed hoisting mechanism and traveling on an overhead fixed-runway structure.

**Power-Operated Crane:** A crane whose mechanism is driven by electricity, air, hydraulics, or internal combustion.

**Pulpit-Operated Crane:** A crane operated from a fixed operator station that is not attached to the crane.

**Remote-Operated Crane:** A crane controlled by an operator not in a pulpit or a cab attached to the crane, by any method other than pendant or rope control (e.g., radio-controlled crane).

**Semigantry Crane:** A gantry crane with one end of the bridge rigidly supported on one or more legs that run on a fixed rail or runway, the other end of the bridge being supported by a truck running on an elevated rail or runway.

**Wall-Mounted Crane:** A crane having a jib, with or without a trolley, supported from a side wall or line of columns of a building. It is a traveling-type crane and operates on a runway attached to the side wall or line of columns.

**Wall-Mounted Jib Crane:** See Cranes, Types Of, Jib Crane.

**CRITICAL DIAMETER:** Diameter of the smallest bend for a given wire rope that permits the wires and strands to adjust themselves by relative movement while remaining in their normal positions.

**CRITICAL ITEM:** A part, assembly, component, or piece of equipment designated as critical by a purchaser or facility operator, because the dropping, upset, or collision of it could: (a) cause damage that would result in schedule delay, (b) cause undetectable damage that could jeopardize future operation or the safety of the facility, (c) result in significant release of radioactivity or other undesirable condition, or (d) present a potentially unacceptable risk of personnel injury or property damage. Critical items may include pumps, heat exchangers, piping subassemblies, other primary-system components, fuel assemblies, large radiation-shielded shipping casks, or other items that require special care in handling because of size, weight, installation in close-tolerance receptors, fragility, extreme susceptibility to damage, or other unusual factors.

**CRITICAL SERVICE:** The use of equipment or tackle for hoisting, rigging, or handling of critical items.

**CYLINDRICAL DRUM:** Hoisting drum of uniform diameter.

**DECELERATION STRESS:** Additional stress imposed on a wire rope due to decreasing the load velocity.

**DEFLECTION:**

- **Sag of a rope in a span, usually measured at midspan as the depth from a chord joining the tops of the two supports.**

- **Any deviation from a straight line.**

**DESIGN FACTOR:** Ratio of ultimate strength to the design working stress.

**DESIGNATED:** Selected or assigned by the employer or the employer’s representative as being qualified to perform specific duties.

**DESIGNATED LEADER:** “An individual assigned responsibility for hoisting and rigging activities requiring more than one person”.

**DIAMETER:** Distance measured across the center of a circle circumscribing the wires of a strand or the strands of a wire rope.

**DIESEL-ELECTRIC TRUCK:** An electric truck in which the power source is a generator driven by a diesel engine.

**DOCKBOARD:** A portable or fixed device for spanning the gap or compensating for the difference in level between loading platforms and carriers.
**DOG-LEG:** Permanent short bend or kink in a wire rope caused by improper use.

**DRAGLINE:** Wire rope used to pull an excavating or drag bucket.

**DRIVE:** Motor, coupling, brake and gear case, or gear cases used to propel bridge, trolley, or hoist.

**DRIVE GIRDER:** A girder on which is mounted the bridge drive, cross shaft, walk, railing, and operator’s cab.

**DRUM:** A cylindrical-flanged barrel of uniform (cylindrical drum) or tapering (conical drum) diameter on which a wire rope is wound for operation or storage. It may be smooth or grooved.

**ELASTIC LIMIT:** Limit of stress beyond which a permanent deformation takes place within the material. This limit is approximately 55–65 percent of breaking strength of steel-wire ropes.

**ELECTRIC TRUCK:** A truck in which the principal energy is transmitted from power source to motor(s) in the form of electricity.

**END CONTROL:** An operator-control position that is located at the end opposite the load end of the truck.

**EQUALIZER:** A device used to compensate for unequal length or stretch of a hoist rope.

**EQUALIZING SLINGS:** Slings composed of wire rope and equalizing fittings.

**EQUALIZING THIMBBLES:** A special type of fitting used as a component part of some wire-rope slings.

**EYE OR EYE SPLICE:** A loop with or without a thimble formed in the end of a wire rope.

**FAIL-SAFE:** A provision designed to automatically stop or safely control any motion in which a malfunction could occur.

**FATIGUE:** A term commonly applied to progressive fracture of any load-supporting member.

**FIBER CENTERS:** Cords or rope made of vegetable fiber used in the core of a strand.

**FIBER CORES:** Cords or rope made of vegetable fiber used in the core of a wire rope.

**FIRST POINT:** The first setting on the operator's controller that starts crane motion (slowly) in each direction.

**FITTING:** Any accessory used as an attachment for wire rope.

**FLAG:** Mark or marker on a rope to designate position of load.

**FLAT ROPE:** Wire rope made of parallel alternating right-lay and left-lay ropes sewn together by relatively soft wires.

**FLATTENED STRAND ROPE:** A wire rope with either oval or triangular strands that present a flattened rope surface.

**FLEET ANGLE:** Angle between the position of a rope at the extreme end wrap on a drum and a line drawn perpendicular to the axis of the drum through the center of the nearest fixed sheave.

**FORKS:** Horizontal tine-like projections, normally suspended from the carriage, used to engage and support loads.

**FORK HEIGHT:** The vertical distance from the floor to the load-carrying surface adjacent to the heel of the forks with the mast vertical, and in the case of reach trucks, with the forks extended.

**FORKLIFT TRUCK:** A high-lift self-loading truck equipped with load carriage and forks for transporting and tiering loads (see Figure 10-3).

**GALVANIZE:** To coat with zinc to protect against corrosion.

**GALVANIZED ROPE:** Rope made of galvanized wire.

**GALVANIZED STRAND:** Strand made of galvanized wire.

**GALVANIZED WIRE:** Wire coated with zinc.

**GAS-ELECTRIC TRUCK:** An electric truck in which the power source is a generator driven by an LP-gas or gasoline engine.

**GROMMET:** A seven-strand wire-rope sling made from one continuous length of strand or an endless synthetic-web sling.
GROOVED DRUM: Drum with grooved outer surface to accommodate and guide a rope.

GROOVES: Depressions in the outer surface of a sheave or drum for positioning and supporting a rope.

GUY LINE: Strand or rope, usually galvanized, for holding a structure in position.

HANDLING FIXTURE: A cradle, structure, shipping fixture, or container designed specifically to facilitate supporting, lifting, or handling a component during fabrication, loading, shipping, storage, or installation.

HIGH-LIFT TRUCK: A self-loading truck equipped with an elevating mechanism designed to permit tiering. Popular types are high-lift platform trucks (see Figure 10-3).

HIGH-LIFT PLATFORM TRUCK: A self-loading truck equipped with an elevating mechanism intended primarily for transporting and tiering loaded skid platforms (see Figure 10-3).

HOIST: A device that applies a force for lifting or lowering.

HOIST, LEVER OPERATED: A lever-operated manual device used to lift, lower, or pull a load and to apply or release tension.

HOLDING LINE: Wire rope on a clamshell or orange-peel bucket that holds the bucket while the closing line is released to dump the load.

HOOK LOAD: The total live weight supported by the hook of a crane, derrick, or other hoisting equipment, including the load, slings, spreader bars, and other tackle not part of the load but supported by the hook and required for the handling of the load.

IDLER: Sheave or roller used to guide or support a rope.

INDEPENDENT WIRE-ROPE CORE: Wire rope used as the core of a larger rope.

INNER WIRES: All wires of a strand except surface or cover wires.

INTERNAL-COMBUSTION ENGINE TRUCK: A truck in which the power source is a gas or diesel engine.

INTERNALLY LUBRICATED: Wire rope or strand having all wires coated with lubricant.

KINK: Permanent distortion of wires and strands resulting from sharp bends.

LAGGING: External wood covering on a reel of rope or a strand.

LANG-LAY ROPE: Wire rope in which the wires in the strands and the strands in the rope are laid in the same direction.

LAY LENGTH: The lengthwise distance on a wire rope in which a strand makes one complete turn around the rope’s axis (see Figure 1-2).

Left Lay:
   o Strand: Strand in which the cover wires are laid in a helix having a left-hand pitch, similar to a left-hand screw.
   o Rope: Rope in which the strands are laid in a helix having a left-hand pitch, similar to a left-hand screw.

Right Lay:
   o Strand: Strand in which the cover wires are laid in a helix having a right-hand pitch, similar to a right-hand screw.
   o Rope: Rope in which the strands are laid in a helix having a right-hand pitch, similar to a right-hand screw.

LIFT:
   o Maximum safe vertical distance through which a hook can travel.
   o The hoisting of a load.

LIFT, CRITICAL: Lifting of parts, components, assemblies, or other items.
designated as critical because the effect of dropping, upset, or collision of them could:

- Present a potentially unacceptable risk of personnel injury or property damage.
- Result in significant release of radioactivity or other undesirable conditions.
- Cause undetectable damage resulting in future operational or safety problems.
- Cause significant work delay.

**LIFT, ORDINARY:** Any lift not designated as a critical lift or a preengineered production lift.

**LIFT, PREENGINEERED PRODUCTION:** Repetitive, production-type lifting operation, independent of the nature of the load to be lifted, in which the probability of dropping, upset, or collision is reduced to a level acceptable to the responsible manager by preliminary engineering evaluation, specialized lifting fixtures, detailed procedures, operation-specific training, and independent review and approval of the entire process.

**LINE:** A rope used for supporting and controlling a suspended load.

**LOAD:** The total weight superimposed on the load block or hook.

**LOAD BLOCK:** The assembly of hook or shackle, swivel, bearing, sheaves, pins, and frame suspended by the hoisting ropes.

**LOAD-BACKREST EXTENSION:** A device extending vertically from the fork carriage frame.

**LOAD-BEARING PARTS:** Any part of a material-handling device in which the induced stress is influenced by the hook load. A primary load-bearing part is a part the failure of which could result in dropping, upset, or uncontrolled motion of the load. Load-bearing parts which, if failed, would result in no more than stoppage of the equipment without causing dropping, upset, or loss of control of the load are not considered to be primary load-bearing parts.

**LOAD CENTER (FORKLIFTS):** The horizontal longitudinal distance from the intersection of the horizontal load-carrying surfaces and vertical load-engaging faces of the forks (or equivalent load-positioning structure) to the center of gravity of the load.

**LOW-LIFT TRUCK:** A self-loading truck equipped with an elevating mechanism designed to raise the load only sufficiently to permit horizontal movement (see Figure 10-3).

**MAGNET:** An electromagnetic device carried on a crane hook and used to pick up loads.

**MAIN HOIST:** The hoist mechanism provided for lifting the maximum-rated load.

**MAN TROLLEY:** A trolley having an operator's cab attached to it.

**MARLINE SPIKE:** Tapered steel pin used in splicing wire rope.

**MESSENGER STRAND:** Galvanized strand or bronze strand used to support telephone and electrical cables.

**MODULUS OF ELASTICITY:** Mathematical quantity giving the ratio, within the elastic limit, between a definite range of unit stress on a wire rope and the corresponding elongation.

**MOUSING:** A method of bridging the throat opening of a hook to prevent the release of load lines and slings, under service or slack conditions, by wrapping with soft wire, rope, heavy tape, or similar materials.

**NARROW-AISLE TRUCK:** A self-loading truck intended primarily for right-angle stacking in aisles narrower than those normally required by counterbalanced trucks of the same capacity (see Figure 10-3).

**NONDESTRUCTIVE EXAMINATION (NDE):** The development and application of technical methods to examine materials or components, in ways that do not impair future usefulness and serviceability, in order to detect, locate, measure, and evaluate discontinuities, defects, and other imperfections; to assess integrity, properties, and composition; and to measure geometrical characteristics.

**NONDESTRUCTIVE TESTING (NDT):** See NONDESTRUCTIVE EXAMINATION.

**NONROTATING WIRE ROPE:** See Rotation-Resistant Wire Rope.

**OPEN SOCKET:** A wire-rope fitting consisting of a basket and two ears with a pin.
ORDER-PICKER TRUCK, HIGH-LIFT: A truck, controllable by an operator stationed on a platform, which is movable, has a load-engaging means, and is intended for (manual) stock selection. The truck may be capable of self-loading and/or tiering (see Figure 10-3).

OVERHEAD GUARD: A framework fitted to a truck over the head of a riding operator.

PALLET TRUCK: A self-loading, nonmotorized or motorized low-lift truck equipped with wheeled forks of dimensions sized to go between the top and bottom boards of a double-faced pallet, the wheels fitting into spaces between the bottom boards, so as to raise the pallet off the floor for transporting (see Figure 10-3).

PEENING: Permanent distortion of outside wire in a rope caused by pounding.

PERSON-IN-CHARGE: The manager or other responsible person (other than the equipment operator) known to be qualified and appointed to be responsible for the safe handling of critical loads and for the safe handling of noncritical items in, around, or above spaces in which critical items are located.

POWERED INDUSTRIAL TRUCK: A mobile, power-driven vehicle used to carry, push, pull, lift, stack, or tier material.

PRECISION LOAD POSITIONING DEVICES: A rigging accessory designed specifically to precisely raise and lower a load through a limited range of lifting/lowering motion (stroke). Standards units typically have 12 in. (30 cm) stroke and can position a load within 0.001 in. (0.025 mm). These devices commonly include a built-in load scale and in such cases may also serve as a load-indicating device.

PREFORMED WIRE ROPE: Wire rope in which the strands are permanently shaped, before being fabricated into the rope, to the helical form they assume in the wire rope.

PREFORMED STRAND: Strand in which the wires are permanently shaped, before being fabricated into the strands, to the helical form they assume in the strand.

PRESTRESSING: Stressing a wire rope or strand before use under such a tension and for such a time that stretch that would otherwise occur once the load is picked up is largely nonexistent.

PROOF TEST: A nondestructive tension test performed to verify construction and workmanship of slings or rigging accessories.

PUBLIC CARRIER: A for-hire company engaged in the public transportation of goods.

QUALIFIED: A person who, by possession of a recognized degree, certificate, or professional standing, or who, by extensive knowledge, training, and experience, has successfully demonstrated an ability and competence to solve or resolve problems relating to the subject matter and work.

QUALIFIED ENGINEER/QUALIFIED ENGINEERING ORGANIZATION: An engineer or engineering organization whose competence in evaluation of the type of equipment in question has been demonstrated to the satisfaction of the responsible manager.

QUALIFIED INSPECTOR: One whose competence is recognized by the responsible manager and whose qualification to perform specific inspection activities has been determined, verified, and attested to in writing.

QUALIFIED OPERATOR: One who has had appropriate and approved training, including satisfactory completion of both written and operational tests to demonstrate knowledge, competence, and skill, in the safe operation of the equipment to be used.

QUALIFIED RIGGER: One whose competence in this skill has been demonstrated by experience satisfactory to the appointed person.

NOTE: The term “rigger” or “qualified rigger” in this standard refers to the function performed, and in no way relates to the worker's classification in any union or bargaining unit.

RATED CAPACITY: The maximum hook load that a piece of hoisting equipment is designed to carry: also the maximum load that an industrial truck or a sling, hook, shackle, or other rigging tackle is designed to carry.

NOTE: At the option of the user, a rated capacity can be assigned that is less than the design-rated capacity.
REACH TRUCK: A self-loading truck, generally high-lift, having load-engaging means mounted so it can be extended forward under control to permit a load to be picked up and deposited in the extended position and transported in the retracted position (see Figure 10-3).

REEL: The flanged spool on which wire rope or strand is wound for storage or shipment.

REEVING: A system in which a rope travels around drums or sheaves.

REGULAR-LAY ROPE: Wire rope in which the wires in the strands and the strands in the rope are laid in opposite directions.

REVERSE BEND: Reeving of a wire rope over sheaves and drums so that it bends in opposite directions.

RIDER TRUCK: A truck that is designed to be controlled by a riding operator.

RIGGING: The hardware or equipment used to safely attach a load to a lifting device. The art or process of safely attaching a load to a hook by means of adequately rated and properly applied slings and related hardware.

ROLLERS: Relatively small-diameter cylinders or wide-faced sheaves used for supporting or guiding ropes.

RUNNING SHEAVE: A sheave that rotates as the load block is raised or lowered.

RUNWAY: Assembly of rails, girders, brackets, and framework on which a crane operates.

SAFE WORKING LOAD: Load that a rope may carry economically and safely.

SEALE: A strand construction having one size of cover wires with the same number of one size of wires in the inner layer and each layer having the same length and direction of lay. Most common construction is one center wire, nine inner wires, and nine cover wires.

SEIZE: To securely bind the end of a wire rope or strand with seizing wire or strand.

SEIZING STRAND: Small strand, usually of seven wires, made of soft-annealed-iron wire.

SEIZING WIRE: A soft-annealed-iron wire.

SELF-LOADER: A truck with tires that can fit between the top and bottom boards of a double-faced pallet.

SERVE: To cover the surface of a wire rope or strand with a wrapping of wire.

SHACKLE: A type of clevis normally used for lifting (see Figure 1-3).

SHALL: A word indicating that an action is mandatory.

SHEAVE: A grooved wheel or pulley used with a rope to change direction and point of application of a pulling force.

SHEAVE, NONRUNNING (EQUALIZER): A sheave used to equalize tension in opposite parts of a rope, called nonrunning because of its slight movement.

SHEAVE, RUNNING: A sheave that rotates as the load block is lifted or lowered.

SHOULD: A word indicating a recommended action, the advisability of which depends on the facts in each situation.

SIDE LOADER: A self-loading truck, generally high-lift, having load-engaging means mounted in such a manner that it can be extended laterally under control to permit a load to be picked up and deposited in the extended position and transported in the retracted position (see Figure 10-3).

SIDE PULL: That portion of a hoist pull acting horizontally when the hoist lines are not operated vertically.
SLINGS: Wire ropes, chains, synthetic web, and metal mesh made into forms, with or without fittings, for handling loads.

SLINGS, BRAIDED: Very flexible slings composed of several individual wire ropes braided together.

SMOOTH-FACED DRUM: Drum with a plain, not grooved, face.

SPAN: The horizontal, center-to-center distance of runway rails.

SPIRAL GROOVE: Groove that follows the path of a helix around a drum, similar to the thread of a screw.

SPLICING: Interweaving of two ends of rope to make a continuous or endless length without appreciably increasing the diameter. Also refers to making a loop or eye in the end of a rope by tucking the ends of the strands.

Splice, Hand Tucked: A loop or eye formed in the end of a rope by tucking the end of the strands back into the main body of the rope in a prescribed manner.

Splice, Mechanical: A loop or eye formed in the end of a wire rope by pressing or swaging one or more metal sleeve over the wire rope junction.

STAINLESS-STEEL ROPE: Wire rope made of chrome-nickel steel wires having great resistance to corrosion.

STEEL-CLAD ROPE: Rope with individual strands spirally wrapped with flat steel wire.

STRAND: An arrangement of wires helically laid about an axis or another wire or fiber center to produce a symmetrical section.

SWAGED FITTINGS: Fittings in which wire rope is inserted and attached by a cold-forming method.

SWITCH, ELECTRIC: A device for making, breaking, or changing the connections in an electrical circuit.

SWITCH, EMERGENCY STOP: A manually or automatically operated electric switch to cut off electric power independently of the regular operating controls.

SWITCH, LIMIT: A switch that is operated by some part or motion of a power-driven machine or equipment to alter the electrical circuit associated with the machine or equipment.

SWITCH, MAIN: A switch controlling the entire power supply to a crane or other equipment, often called the disconnect switch.

TAG LINE: A rope used to prevent rotation of a load.

TAPERING AND WELDING: Reducing the diameter of the end of a wire rope and welding it to facilitate reeving.

THIMBLE: Grooved metal fitting to protect the eye of a wire rope (see Figure 1-4).

Figure 1-4. Thimble.

TIERING: The process of placing one load on or above another.

TINNED WIRE: Wire coated with tin.

TROLLEY: A unit consisting of frame, trucks, trolley drive, and hoisting mechanism moving on the bridge rails in a direction at right angles to the crane runway.

TROLLEY GIRTS: Structural members that are supported on the trolley trucks and that contain the upper sheave assemblies.

TROLLEY TRAVEL: Horizontal travel of a trolley at right angles to runway rails.

TROLLEY TRUCK: An assembly consisting of wheels, bearings, axles, and structural-supporting hoist mechanism and load girts.

TRUCK, POWERED INDUSTRIAL: A mobile, power-propelled truck used to carry, push, pull, lift, stack, or tier material (see Figure 10-3).
**TURNBUCKLE:** A device attached to wire rope for making limited adjustments in length. It consists of a barrel and right- and left-hand threaded bolts.

**TWO-BLOCKING:** The act of continued hoisting in which the load-block and head-block assemblies are brought into physical contact, thereby preventing further movement of the load block and creating shock loads to the rope and reeving system.

**VERIFICATION:** A procedure in which a design, calculation, drawing, procedure, instruction, report, or document is checked and signed by one or more parties. The one or more persons designated to sign verify, based on personal observation, certified records, or direct reports, that a specific action has been performed in accordance with specified requirements.

**WEDGE SOCKET:** Wire-rope fitting in which the rope end is secured by a wedge.

**WHEEL BASE:** Distance between centers of outermost wheels for bridge and trolley trucks.

**WHEEL LOAD:** The load on any wheel with the trolley and lifted load (rated load) positioned on the bridge to give maximum-loading conditions.

**WHEEL LOAD:** The load on any wheel with the trolley and lifted load (rated load) positioned on the bridge to give maximum-loading conditions.

**WHEEL BASE:** Distance between centers of outermost wheels for bridge and trolley trucks.

**WIRE ROPE:** Wire strands laid helically around an axis or a core.

**WIRE (ROUND):** Single continuous length of metal, cold drawn from a rod.

**WIRE (SHAPED):** A single continuous length of metal either cold drawn or cold rolled from a rod.
CHAPTER 2
CRITICAL LIFTS

This chapter provides guidelines for critical-lift determination and requirements for planning and performing a critical lift safely and judiciously.

2.1 CRITICAL-LIFT DETERMINATION ......................................................... 2-1
2.2 CRITICAL-LIFT REQUIREMENTS ......................................................... 2-2
2.1 CRITICAL-LIFT DETERMINATION

a. An appointed person shall classify each lift into one of the DOE categories (ordinary, critical, or preengineered production) prior to planning the lift.

b. A lift shall be designated as a critical lift if unacceptable delay to schedule or other collision, upset, or dropping could result in any one of the following:

1. Unacceptable risk of personnel injury or significant adverse health impact (onsite or offsite).

2. Significant release of radioactive or other hazardous material or other undesirable conditions.

3. Undetectable damage that would jeopardize future operations or the safety of a facility.

4. Damage that would result in unacceptable delay to schedule or other significant program impact such as loss of vital data.

c. A lift should also be designated as critical if the load requires exceptional care in handling because of size, weight, close-tolerance installation, high susceptibility to damage, or other unusual factors.
2.2 CRITICAL-LIFT REQUIREMENTS

a. Ensure that the requirements are met for ordinary lifts specified in each section of this standard for each particular equipment category.

b. The operating organization shall appoint a PIC for the entire operation. This person shall meet the definitions of appointed, designated, and qualified as described in Chapter 1, “Terminology and Definitions,” and shall be present at the lift site during the entire lifting operation.

c. The PIC shall ensure that a pre-job plan or procedure is prepared that defines the operation and includes the following:

1. Identification of the items to be moved, the weight, dimensions, and center of gravity of the load, and any hazardous or toxic materials that are present

2. Identification of operating equipment to be used by type and rated capacity

3. Rigging sketches that include (as applicable):
   i. Identification and rated capacity of slings, lifting bars, rigging accessories, and below-the-hook lifting devices.
   ii. Load-indicating devices.
   iii. Load vectors.
   iv. Lifting points.
   v. Sling angles.
   vi. Boom and swing angles.
   vii. Methods of attachment.
   viii. Crane orientations.
   ix. Other factors affecting equipment capacity.

4. Operating procedures and special instructions to operators including rigging precautions and safety measures to be followed as applicable.

d. Experienced operators who have been trained and qualified to operate the specific equipment to be used shall be assigned to make the lift.

e. Only designated, qualified signalers shall give signals to the operator. However, the operator shall obey a STOP signal at all times, no matter who gives the signal.

f. The procedure and rigging sketches shall be reviewed and approved by the responsible manager (or designee) and the responsible oversight organization (such as safety, quality assurance, or quality control) before the lift is made.

g. A pre-lift meeting involving participating personnel shall be conducted prior to making a critical lift. The critical lift plan/procedure shall be reviewed and questions shall be resolved.

h. If required by the critical lift procedure, a practice lift shall be done before the critical lift. Conditions for a practice lift should closely simulate actual conditions involving: weight, rigging selection and configuration, load movement path, and other relevant factors. Practice lifts should be done by the same crew, using the same lifting equipment.
# CHAPTER 3
## PREENGINEERED PRODUCTION LIFTS

This chapter provides requirements for the design, evaluation, and performance of preengineered production lifts. This lift designation may be used at the discretion of the contractor for selected operations.

INTENTIONALLY BLANK
3.1 GENERAL

a. A preengineered production lift is a repetitive, production-type lifting operation that is independent of the nature of the load to be lifted. Also, the probability of collision, upset, or dropping is reduced to a level acceptable to the responsible manager by preliminary operation evaluation, specialized lifting fixtures, detailed procedures, operation-specific training, and performance of independent review and approval of the entire process.

b. The preengineered production lift is a specialized lift performed by production personnel. The required procedures and controls ensure the safety of the operation and set this category of lift apart from traditional hoisting and rigging activities.
3.2 OPERATION EVALUATION

The following procedure should be used to determine if a lifting operation qualifies as a preengineered production lift.

3.2.1 Load Identification

a. Identify the identical items or group(s) of identical items to be repetitively lifted. Items must have the same dimensions, weight, and center of gravity to be considered identical.

b. Determine the dimensions, weight, center of gravity, and method of attachment of the items.

3.2.2 Task Determination

a. Determine the parameters of motion using the following as applicable:

1. Lifting, rotation, speeds, and travel directions.

2. Actions required with or adjacent to the load.

3. Other lifting operation details that affect safety and stability of the load.

3.2.3 Hazards Evaluation

Determine the consequences that could result from collision, upset, or dropping the load.

3.2.4 Equipment/Rigging Selection

a. Determine the type, class, and minimum capacity of lifting equipment (hoist, crane, forklift, etc.) required for the operation based on the identified load, task, and hazards.

b. Define the type of lifting fixtures required to safely accomplish the required task.
3.3 LIFTING FIXTURES

3.3.1 Design

b. The designer of special lifting fixtures shall be:
   1. A member of a qualified engineering organization.
   2. Qualified in machine design.
   3. Knowledgeable of special lifting fixture design requirements.

c. The designer shall determine the requirements for initial and periodic inspections or tests, including acceptance/rejection criteria and periodic inspection/test intervals.

d. Special lifting fixture designs shall receive a documented review by another member of a qualified engineering organization and the responsible oversight organizations (safety, quality assurance, etc.).

e. Deviations in design that may result in design factors less than consensus standard requirements shall require documented justification and approval of the designer’s manager and the manager of the responsible oversight organizations (safety, quality assurance, etc.).

f. Applications not specifically addressed in the ASME standards or in this standard may be approved by the responsible manager and oversight organizations (safety, quality assurance, etc.) when justification and documentation are provided and all other provisions of this section are met.

3.3.2 Fabrication

Special lifting fixtures shall be fabricated according to the specifications of the approved design package.

3.3.3 Inspection and Testing

a. Before initial use of each special lifting fixture, a qualified inspector shall perform a documented acceptance inspection and test on it. This process shall include:
   1. Verification of configuration of the fixture against the design drawing specifications.
   2. Nondestructive examination as specified in the approved design package.
   3. Proof-testing as specified in the approved design package.

b. Personnel performing the lift shall visually inspect special lifting fixtures before use for visible signs of wear, deformation, deterioration, or damage. Records are not required.

c. A qualified inspector shall conduct periodic, documented inspections as required by the design organization. These inspections shall include preuse inspection requirements (visible signs of wear, deformation, deterioration, or damage) and a formal verification of the current configuration of the fixture against that specified in the approved design package.

d. Equipment to be used (cranes, hoists, forklifts, etc.) shall be inspected according to the appropriate section requirements in this standard for that type of equipment.

3.3.4 Storage, Maintenance, and Control

a. Lifting fixture users shall do the following:
   1. Store special lifting fixtures in an appropriate location to prevent damage or deterioration.
2. Perform and document periodic preventive maintenance as required by the design organization.

3. Establish controls to ensure that special lifting fixtures are used only in the operations for which they were designed.

4. Maintain equipment to be used (cranes, hoists, forklifts, etc.) according to the appropriate section requirements in this standard for that type of equipment.

3.3.5 Modification and Repair

a. Modification to special lifting fixtures shall be designed, approved, and fabricated according to Sections 3.3.1 and 3.3.2 ("Design," and "Fabrication," respectively).

b. Following modification or repair of a load-bearing element of a special lifting fixture, the fixture shall be inspected and tested according to the initial use requirements in Section 3.3.3, "Inspection and Testing."
3.4 PROCEDURES

A detailed, approved, step-by-step procedure shall be developed for the entire operation.

3.4.1 Content

a. At a minimum, each procedure shall contain the following information:

1. Identification of the load to be lifted.

2. Identification of the specific lifting fixtures to be used in the operation.

3. Identification by class and capacity (if applicable) of the types of equipment to be used, such as cranes and hoists.

4. Verification that all equipment, fixtures, and accessories are operative, up-to-date on required periodic inspections and maintenance, and are in good condition before the operation begins.

5. Specific instructions for attachment of the lifting fixtures to the load and to the lifting equipment.

6. Parameters of motion required for the operation.

7. Specific instructions for removal of the lifting fixtures from both the load and the lifting equipment.

3.4.2 Development

a. The methods for developing new procedures, including standard procedure formats, should be clearly defined. Administrative procedures or writers guides should direct the development and review process for procedures at each site to ensure consistency at the site.

b. Qualifications for procedure writers shall be considered, including operating organization and experience.

c. Procedures should reference applicable source documents, such as facility design documents, safety analysis documents, vendor technical manuals, and industry standards.

d. Operating procedures should contain only one action per step.

e. Any necessary warnings, cautions, or notes should be easily identifiable and should not contain any action statements. These items should precede the step to which they apply and should appear on the same page as the step to which they apply.

f. The sequence of procedural steps should conform to the normal or expected operational sequence.

g. Procedures should be developed with consideration for the human-factor aspects of their intended use. For example, references to components should exactly match drawing and label-plate identifiers, and units should be the same as those marked on applicable instrumentation. Important factors should be highlighted, such as operating limits, warnings, and cautions.

3.4.3 Preparation and Revision

a. Appropriately trained personnel shall develop, review, and approve a step-by-step procedure for each lifting operation. The responsible oversight organizations (safety, quality assurance, etc.) shall participate in the review process.

b. Before its first use in the actual production process, the procedure shall undergo a formal verification and validation process using walk-throughs or similar methods to ensure that the steps are appropriate and correct. Any discrepancies found during this process shall be corrected and the process repeated until the procedure is correct.

c. Any changes to an existing, approved procedure shall be performed according to the process specified above. The change shall be evaluated to determine whether the revised procedure must be revalidated and reverified.
3.4.4 Approval

a. Before each procedure is validated, it shall be reviewed and approved by the following personnel:

1. Author of the procedure.

2. Representative of a qualified engineering organization.

3. Representatives of the responsible oversight organizations (e.g., safety, quality assurance).

b. After each procedure is validated, it shall be reviewed and approved by the following personnel:

1. Author of the procedure.

2. Representative of a qualified engineering organization.

3. Representatives of the responsible oversight organizations (i.e., safety, quality assurance).

4. Management of the facility where the procedure will be performed.

5. Management of the production organization performing the procedure.

c. Revisions of procedures shall receive the same depth of review and level of approval as the initial versions received.

All procedures, either new or revised, shall be approved before use.

3.4.5 Review

a. Approved procedures should be reviewed at periodic intervals to ensure that their information and instructions are technically accurate and that appropriate human-factor considerations have been included.

b. The frequency of reviews should be specified for each procedure; it may vary with the type and complexity of the activity involved.

c. Applicable procedures should be reviewed after an incident.

d. During each review, procedures should be compared to source documents to verify their accuracy.

3.4.6 Use

a. A copy of the current issue of the approved procedure shall be in the work area when the operation is performed.

b. Deviations from the approved procedure are not allowed during normal operations.

c. The requirements for use of procedures should be clearly defined and understood by all personnel.

d. If a procedure is determined to be deficient, a procedure change shall be initiated before operations continue.

e. Personnel performing the procedure may take whatever action is necessary during emergency conditions to return the process to a safe and stable condition without first initiating a procedure change.
3.5 DESIGNATED LEADER

a. Each time a preengineered production lift requiring more than one person is performed, a designated leader shall be present at the lift site during the entire operation.

b. Leadership designation may be by written instructions, specific verbal instruction for the particular job, or clearly defined responsibilities within the crew's organizational structure.

c. The designated leader's responsibility shall include the following:

1. Ensure that the personnel involved have received proper and current training and qualification for the procedure.

2. Ensure that the equipment and accessories specified in the procedure are available.

3. Survey the lift site for hazardous or unsafe conditions.

4. Ensure that equipment is properly set up and positioned.

5. Ensure that a signaler is assigned, if required, and identified to the equipment operator.

6. Direct the lifting operation to ensure that it is done safely and efficiently.

7. Stop the job when any potentially unsafe condition is recognized.

8. Direct emergency stabilization operations if an accident or injury occurs.
3.6 TRAINING

Specialized training shall be conducted for personnel involved in performing preengineered production lifts. This training shall be periodically reviewed and approved by the responsible operating and oversight organizations (safety, quality assurance, etc.).

3.6.1 Equipment Operation

a. Personnel shall be trained and qualified on the specific types of equipment required.

b. The equipment operation training shall include:

   1. A demonstration by the individual of operational competence with the equipment.

   2. A demonstration of appropriate safe operating practices.

   3. Documented evidence of the individual's knowledge of safety-related information.

c. Equipment-operation training shall be repeated for personnel whenever a new or different type of equipment is introduced into the procedure.

3.6.2 Procedure

a. Personnel shall be trained and qualified in the proper execution of each specific procedure.

b. The procedure training shall include:

   1. A demonstration by the individual of operational competence in performance of the procedure.

   2. Documented evidence of the individual's knowledge of the steps and requirements of the procedure.

c. Training on a procedure shall be repeated periodically or when a modification to the procedure results in a significant change in the operation.
CHAPTER 4
LIFTING PERSONNEL

This chapter describes requirements for lifting personnel.

4.1 GENERAL ........................................................................... 4-1
4.2 MOBILE CRANES ............................................................... 4-3
4.3 OVERHEAD CRANES ........................................................... 4-4
4.4 PERSONNEL PLATFORM ....................................................... 4-5
4.1 GENERAL

a. This chapter specifies the operation, design, testing, and inspection requirements for the use of personnel lift platforms or baskets suspended from mobile or overhead cranes. This chapter implements the requirements of 29 CFR 1926.550(g) “Cranes and Derricks” and ASME B30.5, “Mobile Cranes.”

b. The manager specifically responsible for the overall work function to be performed shall determine that the erection, use, and dismantling of conventional means of reaching the work site (i.e., scaffold, ladder, stairway, aerial lift, or elevating work platform) would be more hazardous or is not possible because of structural design or worksite conditions.

c. For each personnel lifting procedure, the manager responsible for the task shall authorize the use of a crane-suspended work platform and attest to the need for the operation through a written justification attesting to that need. A statement describing the operation and its time frame shall be included. The statement, after being approved by the authorizer, shall be retained at the job site.

d. These special procedures shall be followed when lifting personnel:

1. The crane shall be inspected daily prior to lifting personnel, in accordance with the requirements for frequent inspections for the type of equipment being used.

2. The lifting and supporting shall be made under controlled conditions and under the direction of a designated leader. A qualified signaler shall be appointed.

3. Prior to use each working shift, the personnel lift platform and rigging shall be inspected.

4. At each new job site (and at least annually) prior to hoisting personnel, the personnel platform, rigging, and hook block shall be proof-tested by a qualified inspector to twice the personnel platform’s rated capacity by holding it suspended for 5 min with the test load suitably distributed on the personnel platform. After proof-testing, any deficiencies revealed by inspection, or by the proof test, shall be corrected and another proof-test conducted. Any modification to the personnel platform or rigging shall require retesting.

5. Prior to lifting personnel and after the proof test, the qualified operator and signaler shall conduct a trial lift with the personnel platform loaded to at least the maximum anticipated load. The trial lift shall be made from ground level (or any other location where employees will enter the platform) to each location at which the platform is to be hoisted and positioned. The designated leader and the operator shall determine that:

   i. Crane (mobile) footing is adequate.

   ii. System controls and safety devices are activated and functioning properly.

   iii. No interferences exist.

   iv. Configurations necessary to reach work locations will allow the crane to remain under 50 percent of rated capacity.

NOTE: Materials and tools to be used during the actual lift, if secured to prevent displacement, can be in the platform for the test lift.

NOTE: A single trial lift may be performed for all locations to be reached from a single setup position.

6. The trial lift shall be repeated prior to hoisting employees whenever:

   i. The crane (mobile) travels or is moved and set up in a new location or returned to a previously used location.

   ii. The lift route is changed, unless the operator determines that the safety of the hoisted personnel is not affected.
7. A visual inspection of the crane, rigging, and personnel platform shall be conducted by a qualified inspector immediately after the trial lift, prior to lifting personnel. Any defects found that create a safety hazard shall be corrected prior to hoisting personnel.

8. After the trial lift and just before hoisting personnel, the platform shall be lifted a few inches and inspected to ensure that it is secure and properly balanced. Personnel shall not be hoisted unless the following conditions exist:
   
i. Hoist ropes are free of kinks.
   
ii. Multiple-part lines are not twisted around each other.
   
iii. The primary attachment is centered over the platform.
   
iv. Ropes are properly seated on drums and sheaves.

9. Prior to the trial lift, a meeting shall be held with the designated leader, qualified operator, signaler, persons to be lifted, and the person responsible for overall worksite safety to plan and review procedures to be followed. Procedures for entering and leaving the personnel platform or other device and the points at which persons will enter and leave the device shall be reviewed.

10. Communications between the crane operator, signaler, and persons being lifted shall be maintained throughout the lift.

11. The employees being hoisted, moved, or positioned shall remain in continuous sight of, and in direct communication with, the operator or signaler. In situations where direct visual contact with the operator is not possible and the use of a signaler would create a hazard for that person, direct communication alone (such as a two-way radio) may be used.

12. Tag lines shall be used unless their use creates an unsafe condition.

13. The crane shall be operated so that lowering will be power-controlled (no free-fall).

14. When welding is done by personnel from the platform or basket, the electrode holders shall be protected from contact with metal components of the personnel platform or basket.

15. Employees working from a platform shall wear body belts/harnesses with lanyards attached to the lower load block or overhaul ball, or to a structural member within the platform that is capable of supporting a fall impact. When working above water, the requirements of 29 CFR 1926.106 (Occupational Safety and Health Regulations for Construction) shall also apply.

16. The operator shall remain at the controls when the personnel platform is occupied.

17. Movement of the personnel platform shall be done in a slow, controlled, cautious manner with no sudden movements of it or the crane. The lifting or lowering speed shall not exceed 100 ft/min (30 m/min).

18. The total weight of the lifted load (including personnel) shall not exceed 50 percent of the crane rating under the planned conditions of use.

19. Suspended personnel platforms shall be used only for personnel, their tools, and sufficient materials to do their work. They shall not be used for transporting bulk materials.

20. Personnel shall keep all parts of their bodies inside the suspended personnel platform during raising, lowering, and positioning to avoid pinch points. Personnel shall not stand on or work from the top rail, midrail, or toeboard of the suspended personnel platform.

21. If the personnel platform cannot be landed, it should be tied to the structure before personnel get off or on.

22. Personnel platforms should not be used in winds greater than 15 mph (25 km/h), electric storms, snow, ice, sleet, or other adverse weather conditions that could affect the safety of personnel.

23. After the personnel platform is positioned, all brakes and locks on the lift crane shall be set before personnel perform any work.

24. No lifts shall be made on another of the crane’s load lines while personnel are suspended on the platform.
4.2 MOBILE CRANES

Mobile cranes are designed and intended for handling materials, not personnel. In addition to the general requirements in Section 4.1, “General,” the following requirements shall be met when lifting personnel with a mobile crane:

a. Personnel are permitted to ride only in one of the following:

1. A personnel platform that is supported from the crane's hook which meets the requirements of Section 4.4, “Personnel Platform.”

2. A personnel basket attached directly to the boom which is approved by the crane manufacturer.

b. Cranes and derricks with variable-angle booms shall be equipped with a boom-angle indicator that is readily visible to the operator.

c. Cranes with telescoping booms shall be equipped with a device to indicate clearly to the operator, at all times, the boom's extended length, or an accurate determination of the load radius to be used during the lift shall be made prior to hoisting personnel.

d. A positive-acting device shall be used that prevents contact between the load block or overhaul ball and the boom tip (anti-two-blocking device), or a system shall be used that deactivates the hoisting action before damage occurs in the event of a two-blocking situation (two-block damage-prevention feature).

e. The crane shall be uniformly level within 1 percent of level grade and located on firm footing.

f. Cranes shall not travel while personnel are on a personnel platform or in the basket.

g. Cranes with outriggers shall have the outriggers fully extended and blocked.
4.3 OVERHEAD CRANES

Overhead cranes are designed and intended for handling materials, not personnel. In addition to the general requirements in Section 4.1, the following requirements shall be met when lifting personnel with an overhead crane.

a. Personnel are permitted to ride only in a personnel platform that is supported from the crane's hook which meets the requirements of Section 4.4.

b. A hoist-limit switch/device shall be provided in the hoisting direction to stop the hoisting motion to prevent two-blocking.
4.4 PERSONNEL PLATFORM

Use only personnel platforms that are specifically designed and constructed for the purpose of suspending personnel according to the following:

a. The personnel platform shall be designed by a qualified person competent in structural design. All welding of the platform shall be performed by a certified welder familiar with the weld grades, types, and material specified in the design.

b. The personnel platform shall be limited to carrying six persons.

c. The personnel platform and rigging shall be capable of supporting, without failure, at least five times the maximum intended load.

d. The personnel platform shall bear a plate specifying its empty weight and the maximum number of persons and weight for which it is rated.

e. The personnel platform shall have perimeter protection consisting of a top rail approximately 45 in. (115 cm) high, a toeboard at least 4 in. (10 cm) high, and a midrail approximately halfway between the top rail and the toeboard.

f. A grab rail shall be provided inside the personnel platform to minimize hand exposure.

g. The sides of the platform shall be enclosed from the toeboard to the midrail with solid construction or expanded metal having openings no greater than ½ in. (1.27 cm).

h. If access doors are installed, they shall open only to the interior of the personnel platform. Access doors shall be equipped with a device to prevent them from opening unintentionally.

i. The personnel platform shall have overhead protection when there is an overhead hazard.

j. Sufficient headroom shall be provided to allow employees to stand upright in the platform.

k. Rough edges exposed to contact by employees shall be surfaced (ground smooth) to prevent injury.

l. The personnel platform shall be easily identifiable by high-visibility color or marking.

m. All welding procedures and welding operator qualifications shall be in accordance with ANSI/AWS D1.1 when welding is to be performed on load-sustaining members. Where special steels or other materials are used, the manufacturer shall provide welding procedures. Welds shall be inspected by a qualified inspector.

n. When being supported by a crane, the platform shall be attached to the hoist rope by a hook of a type that can be closed and locked, eliminating the hook throat opening. Alternatively, an alloy-steel anchor shackle with a bolt, nut, and retaining pin may be used.

o. All eyes in wire-rope slings shall be fabricated with thimbles. No rigging accessories for attaching the personnel platform to hoist lines shall be used for any other purpose when not hoisting personnel.

p. The suspension system shall minimize inclination of the personnel platform due to the movement of personnel on it.
CHAPTER 5
HOSTILE ENVIRONMENTS

This chapter describes provisions for hoisting and rigging operations in hostile work environments.

5.1 GENERAL .............................................................. 5-1

5.2 HOSTILE ENVIRONMENT PLAN ...................................................... 5-2
  5.2.1 Marking and Posting .......................................................... 5-2
  5.2.2 Inspection and Testing ....................................................... 5-2

Exhibit I Hostile Environment Plan .................................................. 5-4
5.1 GENERAL

a. This chapter contains the special provisions for hoisting and rigging operations and equipment in hostile environments where standard operating, maintenance, inspection, or test procedures cannot be followed as a result of radiation or radioactive contamination, toxic/hazardous chemicals or gases, or temperature extremes.

b. Hoisting and rigging activities can usually be accomplished where the environment will allow normal operations with access for hands-on equipment contact. In those situations, operations, maintenance, inspections, and tests shall be done in accordance with regular provisions of this standard.

c. Hoisting and rigging equipment or operations shall be reviewed by a designated person to determine compliance with the requirements of this standard. If it is determined to be impossible or unreasonable for the requirements of this standard to be met as a result of hostile environmental conditions, a hostile environment plan shall be prepared to document alternative compliance methods and procedures.

d. All hoisting and rigging operations shall be consistent with DOE’s policy of as-low-as-reasonably achievable (ALARA) radiation exposure.

e. Safety of personnel shall remain the first priority.
5.2 HOSTILE ENVIRONMENT PLAN

a. A hostile environment plan shall be prepared by a designated person and shall cover operations, equipment, inspection, testing, and maintenance. See Exhibit I, Hostile Environment Plan, at the end of this chapter.

b. At a minimum, the plan shall be reviewed and approved by responsible management at the facility where the crane, hoist, or other equipment is located and by responsible management of an overview organization such as safety or quality assurance. While the site-specific organizational structure will determine other required reviews and approvals, approval by the following is recommended:

1. Responsible operations manager.
2. Equipment custodian.
3. Cognizant engineer.

c. The plan shall address only those actions or features that require deviation from the requirements of this standard due to a hostile environment. At a minimum, it shall contain the following information:

1. The specific requirements that cannot be met.
2. The difference between the requirement and actual conditions.
3. Justification for not meeting this standard's requirements.
4. A statement of actions or features to be used to compensate for the differences.
5. Specific maintenance, inspections, and tests to be performed whenever access is possible.
6. Replacement or retirement criteria for equipment that is designed to operate with little or no maintenance.

d. Detailed operation, inspection, testing, and maintenance procedures that state specific requirements and acceptance criteria shall be prepared, based on the hostile environment plan.

e. The responsible manager shall ensure that the approved hostile environment plan is distributed as follows:

   1. DOE Field Office or equivalent (for information).
   2. Equipment operators, maintenance organizations, and other organizations/personnel affected by the plan.

f. Hostile environment plans in the equipment history file shall be readily available to appointed personnel.

5.2.1 Marking and Posting

Equipment the use of which is required by a hostile environment plan shall be posted with the following information: “Special Maintenance and Operating Instructions Required—see Hostile Environment Plan.”

5.2.2 Inspection and Testing

a. Handling fixtures and rigging accessories shall be qualified in accordance with Chapters 11, 12, and 14 (“Wire Rope and Slings,” “Rigging Accessories,” and “Below-the-Hook Lifting Devices,” respectively) of this standard prior to being exposed to the hostile environment.

b. Nylon (rope or webbing) slings should not be used in a radiation area unless absolutely necessary. When it is necessary to use a nylon or polyester sling in a radiation area, the responsible manager shall ensure that radiation exposure does not exceed 100,000 rad during the life of the sling.
Exhibit I is intended to be a sample form only and is not mandatory. Any other form that accomplishes the purpose is acceptable.
EXHIBIT I

HOSTILE ENVIRONMENT PLAN

CHAPTER 6
PERSONNEL QUALIFICATION AND TRAINING

This chapter describes personnel qualification and training. Only qualified personnel shall operate the equipment covered in this standard.

6.1 GENERAL .............................................................. 6-1

6.2 QUALIFICATION ........................................................ 6-2
  6.2.1 General .......................................................... 6-2
  6.2.2 Operators of Cab-Operated and Pulpit-Operated Cranes .......... 6-2
  6.2.3 Operators of Mobile Cranes ..................................... 6-2
  6.2.4 Operators of Floor-Operated Cranes .............................. 6-3
  6.2.5 Operators of Forklift Trucks .................................... 6-4
  6.2.6 Riggers .......................................................... 6-4
  6.2.7 Person-In-Charge (PIC) ......................................... 6-4
  6.2.8 Designated Leader ............................................... 6-4
  6.2.9 Inspectors ...................................................... 6-4
  6.2.10 Instructors .................................................... 6-4
  6.2.11 First-Line Supervisors ........................................ 6-4
  6.2.12 Maintenance Personnel ....................................... 6-5

6.3 TRAINING .............................................................. 6-6
  6.3.1 General .......................................................... 6-6
  6.3.2 Operators of Cab-Operated, Pulpit-Operated, and Floor-Operated Cranes 6-6
  6.3.3 Mobile Crane Operators ........................................ 6-7
  6.3.4 Forklift Truck Operators ...................................... 6-7
  6.3.5 Riggers .......................................................... 6-8
  6.3.6 Inspectors ...................................................... 6-9
  6.3.7 Instructors .................................................... 6-9

6.4 REQUALIFICATION .................................................... 6-10

6.5 RECORDS .............................................................. 6-11
6.1 GENERAL

a. This chapter delineates the requirements for the qualification and training of operators, riggers, inspectors, and trainers.

b. Personnel who are designated to operate equipment or perform work covered by this standard shall be qualified and trained to the level of proficiency consistent with assigned tasks.
6.2 QUALIFICATION

6.2.1 General

Only qualified personnel or trainees, under the direct supervision of qualified personnel, who meet the following requirements shall be allowed to rig, operate, or inspect cranes, hoists, or powered forklift trucks:

a. Be at least 18 years old.

b. Understand spoken and written English or a language generally in use at the work location.

6.2.2 Operators of Cab-Operated and Pulpit-Operated Cranes

a. Operators and operator trainees shall meet the following physical qualifications.

1. Have vision of at least 20/30 Snellen in one eye and 20/50 in the other, with or without corrective lenses. Operators whose jobs do not require binocular vision (operation of cranes with television cameras or periscope optics) shall have distant visual acuity of 20/30 in one eye and no specific visual requirement for the other eye.

2. Be able to distinguish colors, regardless of position, if color differentiation is required for operation.

3. Have adequate hearing, with or without a hearing aid, for a specific operation.

4. Have physical strength, coordination, and sufficient reaction speed to meet the demands of equipment operation.

5. Show no evidence of physical defects or of emotional instability that could be a hazard to themselves or others, or which, in the opinion of the examiner, could interfere with their safe performance; such evidence may be sufficient cause for disqualification. In these cases, medical judgments and tests may be required.

6. Show no evidence of being subject to seizures or to loss of physical control; such evidence shall be sufficient reason for disqualification. Medical examinations may be required to determine these conditions.

7. Have normal depth perception, field of vision, manual dexterity, coordination, and no tendencies to dizziness or similar potentially hazardous characteristics.

8. Have no detectable or known disease or physical restriction that would render them incapable of safely operating equipment or carrying out rigging duties. Where any deficiency of an upper or lower extremity exists, the acceptability of a candidate shall be the decision of the supervisor, after consulting with the designated physician.

b. Operators shall be required by the employer to pass a practical operating skill evaluation. Qualification shall be limited to the type of equipment for which the operator is being evaluated. The actual or simulated operation shall enable trainees to demonstrate basic knowledge and skills at a level that ensures the safety of personnel and equipment.

6.2.3 Operators of Mobile Cranes

a. Operators and operator trainees shall meet the following physical qualifications.

1. Have vision of at least 20/30 Snellen in one eye and 20/50 in the other, with or without corrective lenses.

2. Be able to distinguish colors, regardless of position, if color differentiation is required for operation.

3. Have adequate hearing, with or without a hearing aid, for a specific operation.

4. Have physical strength, coordination, and sufficient reaction speed to meet the demands of equipment operation.

5. Show no evidence of physical defects or of emotional instability that could be a hazard to themselves or others, or which, in the opinion of the examiner, could interfere with their safe performance; such evidence may be sufficient cause for disqualification. In these cases, medical judgments and tests may be required.

6. Show no evidence of being subject to seizures or to loss of physical control; such
evidence shall be sufficient reason for disqualification. Medical examinations may be required to determine these conditions.

7. Have normal depth perception, field of vision, manual dexterity, coordination, and no tendencies to dizziness or similar potentially hazardous characteristics.

8. Have no detectable or known disease or physical restriction that would render them incapable of safely operating equipment or carrying out rigging duties. Where any deficiency of an upper or lower extremity exists, the acceptability of a candidate shall be the decision of the supervisor, after consulting with the designated physician.

9. Shall successfully pass with a negative result, a substance abuse test. The level of testing will be determined by the standard practice for the industry where the crane is employed and this test shall be confirmed by a recognized laboratory service.

10. Operator physical examinations shall be required every three years or more frequently if supervision deems it necessary.

b. Operators shall be required by the employer to satisfactorily pass a written examination covering operational characteristics, controls, and emergency control skills such as response to:

1. Fire.
2. Power line contact.
3. Loss of stability.
4. Control malfunction.
5. As well as characteristic and performance questions appropriated to the crane type for which qualifications is sought.

c. Operators shall demonstrate their ability to read, write, comprehend and exhibit arithmetic skills and load/capacity chart usage, in the language of the crane manufacturer’s operations and maintenance instruction materials.

d. Operators shall satisfactorily complete a combination written and verbal test on load/chart usage that covers a selection of the configurations (the crane may be equipped to handle) for the type crane for which qualification is being sought.

e. The operator shall complete a practical operating skill evaluation test (actual or simulated), demonstrating proficiency and basic knowledge in handling the specific type crane for which the operator is being evaluated, including:

1. Pre-start and post-start inspection.
2. Maneuvering skills.
4. Securing the crane.

f. Qualification shall be limited to the type of equipment for which the operator is being evaluated.

g. Trainee qualification requirements shall include but not limited to the following:

1. Satisfactory completing of a written examination covering safety, operational characteristics and limitations, and controls of the type crane for which they are being qualified.

2. Demonstrate their ability to read, write, comprehend, and exhibit arithmetic skills and load/capacity chart usage, in the language of the crane manufacturer’s operations and maintenance instruction materials.

3. Satisfactory completion of a combination written and verbal test on load/chart usage covering various crane configurations.

### 6.2.4 Operators of Floor-Operated Cranes

a. Physical qualifications shall be based on specific job requirements.

b. Operators shall be required by their employer to pass a practical operating skill evaluation. Qualification shall be limited to the type of equipment for which the operator is being evaluated.

c. The actual or simulated operation shall enable operators to demonstrate basic knowledge and skills at a level that ensures the safety of personnel and equipment.
6.2.5 Operators of Forklift Trucks

a. Physical qualifications shall be based on specific job requirements.

b. Operators shall be required by the employer to pass a practical operating skill evaluation. Qualification shall be limited to the type of forklift for which the operator is being evaluated.

c. The actual or simulated operation shall enable operators to demonstrate basic knowledge and skills at a level that ensures the safety of personnel and equipment.

6.2.6 Riggers

Riggers shall be required to pass a practical rigging skill evaluation that requires the use of rigging equipment in safe configurations. The actual or simulated operation shall enable personnel to demonstrate basic knowledge and skills at a level that ensures the safety of personnel and equipment.

6.2.7 Person-In-Charge (PIC)

The PIC shall have the necessary knowledge and experience of the specific type of equipment and the hazards of critical lifts to direct the safe completion of the operation. The PIC shall understand the rules and procedures implemented at the site to ensure that the following are completed:

a. Necessary administrative requirements.

b. Personnel assignments and responsibilities.

c. Selection of proper equipment/tools.

d. Recognition and control of hazardous or unsafe conditions.

e. Job efficiency and safety.

f. Critical-lift documentation.

In addition, the PIC shall

a. Direct operations in the case of an accident.

b. Exercise authority to start and stop work activities.

6.2.8 Designated Leader

The designated leader shall have sufficient knowledge and experience to accomplish the following responsibilities:

a. Ensure that personnel involved understand how the lift is to be made.

b. Ensure that the weight of the load is determined and that proper equipment and accessories are selected.

c. Survey the lift site for hazardous or unsafe conditions.

d. Ensure that equipment is properly set up and positioned.

e. Ensure that a signaler is assigned, if required, and is identified to the operator.

f. Direct the lifting operation to ensure that the job is done safely and efficiently.

g. Stop the job when any potentially unsafe condition is recognized.

h. Direct operations if an accident or injury occurs.

6.2.9 Inspectors

Qualified inspectors shall have the necessary knowledge and experience to properly inspect hoisting and rigging equipment.

6.2.10 Instructors

Instructors responsible for developing or presenting hoisting and rigging training programs shall meet the qualification standards specified by the responsible training organization.

6.2.11 First-Line Supervisors

The first-line supervisor of hoisting and rigging operations should be knowledgeable of the specific types of hoisting and rigging operations under their supervision and their operational hazards. The supervisor shall be familiar with applicable rules and procedures implemented at the site to ensure that hoisting and rigging work under their control is done efficiently and safely, with safety as top priority. Supervisors should ensure that employees fully understand the importance of safety and that they recognize
their own authority and responsibility to stop work when safety is questionable.

6.2.12 Maintenance Personnel

a. Employees who perform maintenance activities on equipment covered by this handbook should have an understanding of the following criteria:

1. The tools to safely accomplish their work.

2. Access to operating instructions to perform adjustments.

3. Parts information furnished by the manufacturer or the responsible maintenance/engineering organization.

4. Manufacturers' recommendations as to points and frequency of lubrication and levels and types of lubricant to be used.

5. Maintenance and repair procedures recommended by the manufacturer or responsible maintenance/engineering organization.

6. Wiring diagrams.

7. Documentation requirements for maintenance and repair.
6.3 TRAINING

6.3.1 General

a. Organizations that employ personnel who operate, rig, or inspect equipment covered in this standard shall provide training programs, including a means of evaluation, to ensure that the personnel are competent to perform the operations.

b. Training programs for operators should address two levels of required performance.

1. Persons who may operate pendant-controlled cranes, manual hoists, and forklifts as an incidental part of their normal work assignment.

2. Persons whose principal assignment is the performance of hoisting and rigging work.

c. The training organization shall use training methods best suited for the students and the subject material. This may include, but is not limited to, computer-aided training, classroom training, simulated field training, on-the-job training (OJT), and training by equipment manufacturer or commercial training companies.

d. Score standards shall be set for each examination by the training organization. The minimum passing score will depend on the subject, testing technique, and test difficulty. Management shall determine the course of action for persons receiving negative evaluations.

6.3.2 Operators of Cab-Operated, Pulpit-Operated, and Floor-Operated Cranes

a. Only qualified and authorized operators or operator trainees under the direct supervision of a qualified operator shall be permitted to operate cab-operated, pulpit-operated, and floor-operated cranes.

b. The initial training of operators shall include:

1. Applicant training on equipment for which qualification is sought, under the direction of a qualified operator who is designated by management to instruct in the operation of hoisting equipment.

2. Instructor review of the applicant’s knowledge, including results of written and oral evaluation, and witnessing a demonstration of the operator’s skills.

c. Operators should be able to demonstrate a knowledge of equipment operating characteristics, capabilities, limitations, effects of variables, safety features, and operating procedures. The following checklist contains basic factors with which an operator should be familiar. This checklist must be tailored to suit actual conditions.

1. Operating characteristics.

2. Environmental hazards—weather.

3. Electrical hazards.

4. Traveling with load.

5. Traveling without load.

7. Inspections/tests.

8. Load weight estimation.

10. Rigging.

11. Lessons learned.

13. Load dynamics.

15. Critical lifts.

16. Safety features of equipment.

17. Terminology and definitions.

18. Ropes and reeving.

19. Two-blocking.

20. Records and documents.

22. Operating practices.
23. Fire protection.
24. Crane components.
25. Access and egress.
26. Warning devices.

6.3.3 Mobile Crane Operators

a. Only qualified and authorized operators or operator trainees under the direct supervision of a qualified operator shall be permitted to operate mobile cranes.

b. Operators shall meet the criteria specified in paragraphs 6.3.2.b and c, and they should also be able to demonstrate an understanding of the following:

1. Stability.
2. Load charts.
3. Crane setup.
4. Refueling.
5. Lifting operations involving multiple cranes.
6. Assembly and disassembly.
7. Outriggers.
8. Operator aids.

6.3.4 Forklift Truck Operators

a. Only qualified and authorized operators shall be permitted to operate powered forklift trucks. Operator trainees may operate powered forklift trucks under the direct supervision of a qualified operator or trainer and only where such operations does not endanger the trainee or other employees.

b. The initial training of operators shall include:

1. A combination of formal instruction (e.g., lecture, discussion, interactive computer learning, video tape, written material).

2. Practical training (demonstrations performed by the trainer and practical exercises performed by the trainee).

3. Evaluation of the operator’s performance in the workplace including results of written and oral evaluation, and witnessing a demonstration of the operator's skills.

c. The following checklist contains basic factors with which a forklift truck operator should be familiar. This checklist must be tailored to suit actual conditions.

1. Operating instruction, warnings, and precautions for the type of forklift truck the operator will be authorized to operate.

2. Differences between the forklift truck and the automobile.

3. Forklift truck controls and instrumentation:
   i. Where they are located.
   ii. What they do.
   iii. How they work.

4. Engine or motor operation.

5. Steering and maneuvering.

6. Visibility, including restrictions due to loading.

7. Fork and attachment adaptation, operation, and use limitations.

8. Forklift truck capacity and load weight determination.

10. Forklift truck inspections and maintenance that the operator will be required to perform.

11. Refueling and/or charging and recharging of batteries.

12. Operating limitations.
13. Any other operating instructions, warning, or precautions listed in the operator’s manual for the type of forklift truck that the employee is being trained to operate.

14. Traveling with and without a load.

15. Lifting personnel.

17. Lessons learned.

19. Applicable standards and regulations.

22. Terminology and definitions.

23. Records and documents.

24. Operating practices.

25. Fire protection.

d. Refresher training in relevant topics shall be provided to the operator when:

1. The operator has been observed to operate the forklift truck in an unsafe manner.

2. The operator has been involved in an accident or near-miss incident.

3. The operator has received an evaluation that reveals that the operator is not operating the forklift truck safely.

4. The operator is assigned to drive a different type of forklift truck.

5. A condition in the workplace changes in a manner that could affect the safe operation of the forklift truck.

6.3.5 Riggers

a. Training programs for riggers should address two levels of required performance:

1. Persons who may perform rigging functions as an incidental part of their normal work assignment.

2. Persons whose principal assignment is the performance of rigging work.

b. Only qualified and authorized riggers or rigger trainees under the direct supervision of a qualified rigger shall be permitted to perform rigging functions.

c. Initial training of riggers shall include the instructor's review of the applicant's knowledge, including results of written or oral evaluation, and witnessing a demonstration of the operator's skills. The following checklist contains basic factors with which a rigger should be familiar. This checklist must be tailored to suit actual conditions.

1. Stability (equipment).

2. Operating characteristics of equipment.

3. Environmental hazards—weather.

4. Electrical hazards.

5. Traveling with load/load control.

7. Inspection/tests.

8. Load weight estimation.

10. Rigging equipment selection.

11. Lessons learned.

13. Lifting operations involving multiple cranes.

15. Assembly and disassembly.

16. Load dynamics.

17. Applicable standards and regulations.

18. Critical lifts.

19. Safety features of equipment.

20. Terminology and definitions.
21. Ropes and reeving.
22. Records and documentation.
23. Adjustments and repairs.
24. Rigging/operating practices.
25. Sling loading.
27. Personal protective equipment.
29. Rigging or hitch configuration.
30. D/d ratio.
31. Sling types and application.

6.3.6 Inspectors

a. Employees who perform required, documented inspections of equipment covered by this standard shall receive inspector training.

b. Inspector training shall include basic inspection techniques and acceptance/rejection criteria as specified in this standard and other applicable sources. See Chapter 3, “Preengineered Production Lifts.”

c. The following equipment categories for general inspection are examples that should be considered:

1. Overhead, gantry, and polar cranes.
2. Monorail, jib, and other hoists.
3. Mobile cranes (hydraulic and lattice boom).
4. Forklift trucks.
5. Wire-rope, chain, and synthetic-web slings.
6. Rigging accessories.

6.3.7 Instructors

a. Instructors designated by management to be responsible for developing or presenting hoisting and rigging training programs shall develop technical competence by becoming familiar with the requirements of this standard and by satisfactorily completing documented training or technical experience in the hoisting and rigging discipline.

b. Instructors should attend recognized training courses, workshops, or seminars in order to remain current on industry practices and changes in applicable codes and standards.
6.4 REQUALIFICATION

a. Operator, rigger, and inspector qualification is for a period not to exceed 3 years, unless the qualification is revoked sooner by the employee's manager.

b. The program for requalification shall include:

1. Completion of a written or oral evaluation relevant to the type of equipment used or participation in a refresher training program.

6.5 RECORDS

A record of training and skill evaluations shall be kept on file and shall be readily available.
INTENTIONALLY BLANK
CHAPTER 7
OVERHEAD AND GANTRY CRANES

This chapter specifies operation, inspection, maintenance, and testing requirements for the use of overhead and gantry cranes and implements the requirements of ASME B30.2 ("Overhead and Gantry Cranes (Top-Running Bridge, Single or Multiple Girder, Top-Running Trolley Hoist)"), B30.11 ("Monorail Systems and Underhung Cranes"), and B30.17 ("Overhead and Gantry Cranes (Top-Running Bridge, Single Girder, Underhung Hoist)"). Only equipment built to the appropriate design standards shall be used in DOE installations.

Exhibit I Bridge, Wall, Gantry Crane Load Test and Inspection ......................... 7-19
7.1 GENERAL

Overhead and gantry cranes include top-running single- or multiple-girder bridge with top-running trolley hoists (Figure 7-1), top-running single-girder bridge with underhung trolley hoists (Figure 7-2), and monorails/underhung cranes (Figure 7-3).

7.1.1 Operator Training/Qualification

Operators of overhead cranes shall be trained and qualified as required in Chapter 6, “Personnel Qualification and Training.”

7.1.2 Rated-Load Marking

The rated capacity shall be marked on each side of the crane. If the crane has more than one hoisting unit, each hoist shall have its rated capacity marked on it or on its load block. Markings on the bridge, trolley, and load block shall be legible from the ground or floor.

7.1.3 Modification

Cranes may be modified or rerated provided that the modifications or supporting structures are analyzed thoroughly by a qualified engineer or by a manufacturer of cranes. Modifications and reratings must be approved by the cognizant safety organization. A rerated crane, or one whose load-supporting components have been modified, shall be tested in accordance with Section 7.3, “Testing.” The new rated capacity shall be displayed in accordance with Section 7.1.2, “Rated-Load Marking.”

7.1.4 Egress

On cab-operated cranes, there shall be at least two means of egress from the crane, remote from each other, and arranged to permit departure under emergency conditions.

7.1.5 Hoist Brakes

a. Each independent hoisting unit shall be equipped with at least one holding brake applied directly to the motor shaft or some part of the gear train.

b. Each independent hoisting unit (except worm-gear hoists, the angle of whose worm prevents the load from accelerating as it is being lowered) shall be equipped with a controlled-braking means in addition to the holding brake to control speed of lowering.

c. Holding brakes on hoists shall be applied automatically when power is removed.

7.1.6 Power Shutoff

a. The power supply for the runway conductors shall be controlled by a switch or circuit-breaker located on a fixed structure, accessible from the floor, and capable of being locked in the OPEN position.

b. On cab-operated cranes, an enclosed switch or circuit-breaker (with provisions for locking in the OPEN position) shall be provided in the leads from the runway conductors. A means of opening this device shall be located within reach of the operator when the operator is in the operating position. When the operator opens this switch or circuit-breaker, the holding brakes should set.

c. On floor, remote, or pulpit-operated cranes, an enclosed disconnect device shall be provided in the leads from the runway conductors. This device shall be mounted on the bridge or footwalk near the runway collectors. There shall be provisions for locking the device in the OPEN position unless the crane is the only load on a lockable switch or circuit-breaker that is accessible from the floor. One of the following types of floor, remote, and pulpit-operated disconnects shall be provided.

1. A nonconductive rope attached to the main disconnect device on a floor-operated crane. If this is selected, the rope shall be suspended adjacent to the operating ropes if manual controllers are used, or near the pendant push-button station if magnetic controllers are used.

2. An under-voltage trip for a main circuit-breaker, operated by an emergency stop button in the pendant push-button station or the pulpit.
Figure 7-1. Top-running single- or multiple-girder bridge with top-running trolley hoist.
Figure 7-2. Top-running single-girder bridge with underhung trolley hoist.
Figure 7-3. Monorails and underhung cranes.
3. A main-line contactor operated by a switch or push button on the pendant push-button station, the remote-control station, or the pulpit.

7.1.7 Hoist-Limit Switch

a. The hoisting motion of all cranes shall have an overtravel-limit switch/device in the hoisting direction to stop the hoisting motion.

b. Lower-travel limit switches/devices should be provided for all hoists where the load block enters pits or hatchways in the floor.

7.1.8 Load Limits

The crane shall not be loaded beyond its rated capacity except for test purposes, as described in Section 7.3.

7.1.9 Maintenance History

The maintenance history of the crane shall be retained throughout its service life.
7.2 INSPECTIONS

7.2.1 General

There shall be no apparent damage, excessive wear, or deformation of any load-bearing part of the equipment. Brakes shall work satisfactorily and load brakes shall be designed to hold any load up to at least 125 percent of the rated capacity of the equipment without slipping or overheating. All safety devices, load indicators, controls, and other operating parts of the equipment shall be checked during each inspection and shall be in good working order. Parts found to be defective during any inspection or nondestructive examination shall be replaced or repaired as directed by the responsible line manager or that person's designated representative.

7.2.2 Crane Service

Crane service is defined as follows:

a. Normal service—operating at less than 85 percent of rated load and not more than 10 lift cycles/hr except for isolated instances.

b. Heavy service—operating at 85 to 100 percent of rated load or in excess of 10 lift cycles/hr as a regular specified procedure.

c. Severe service—operating at normal or heavy service under abnormal operating conditions (i.e., extreme temperatures, corrosive atmospheres).

7.2.3 Initial Inspection

Prior to their initial use, all new, reinstalled, modified, or repaired cranes shall be inspected by a qualified inspector to ensure compliance with applicable provisions of this chapter. Inspections of repaired and modified cranes may be limited to the provisions affected by the alteration, repair, or modification as determined by a qualified person. Dated and signed inspection reports shall be kept on file and shall be readily available.

7.2.4 Daily Preoperational Check

a. Operators or other designated personnel shall visually inspect items such as the following each day or prior to first use if the

hoist has not been in regular service (records are not required):

1. Controls and operating mechanisms for proper operation.

2. Hoist upper-limit switch/device for proper operation at the beginning of each shift or prior to use if hoist has not been in regular service.

3. Lines, valves, and other parts of air systems for leakage.

4. Hooks for cracks, deformation and damage from chemicals (see Chapter 13, “Load Hooks,” for additional hook requirements).

5. Hoist rope for significant wear, kinking, crushing, birdcaging, and corrosion. The inspection shall be made by running out as much of the rope or chain as is necessary to visually examine those portions that flex over sheaves, sprockets, and the like, and other areas subject to wear or abrasion.

6. Hoist chain for nicks, gouges, distortion, wear, and corrosion.

7. Hook latch, if used, for proper operation.

b. Operators or other designated personnel shall examine deficiencies and determine whether they constitute a hazard and whether a more detailed inspection is required.

7.2.5 Monthly Rope, Chain, and Hook Inspection

a. The operator or other designated person shall visually inspect the following items for damage, wear, or other deficiency that might reduce capacity or adversely affect the safety of the crane:

1. hoist rope or chain

2. hooks

b. Lower the hook block to its lowest position and examine for any condition that could result in an appreciable loss of strength.
c. Hoist rope for significant wear, kinking, crushing, birdcaging, and corrosion.

d. Hoist chain for nicks, gouges, distortion, wear, and corrosion.

e. Hooks for cracks, deformation, damage from chemicals, latch engagement (if provided), and evidence of heat damage.

f. Signed and dated inspection records shall be kept on file and shall be readily available.

g. Before the crane is returned to service, correct deficiencies that could reduce its capacity or adversely effect its safety.

7.2.6 Frequent Inspection

a. Operators or other designated personnel shall visually inspect the crane at the following intervals (records are not required):

1. Normal service—monthly.
2. Heavy service—weekly to monthly.
3. Severe service—daily to weekly.

b. In addition to the requirements of Section 7.2.4, “Daily Preoperational Check,” these inspections shall include the following:

1. Hoist braking system for proper operation.
2. Hoist rope or chain reeving for compliance with hoist manufacturer’s recommendations.
3. Observations during operation.

c. Operators or other designated personnel shall examine deficiencies and determine whether a more detailed inspection is required.

7.2.7 Periodic Inspection

a. A qualified inspector shall perform a complete inspection at the following intervals:

1. Normal service—yearly.
2. Heavy service—semiannually.

b. The qualified inspector shall examine deficiencies and determine whether they constitute a safety hazard and whether the crane should be removed from service until it is repaired.

c. Dated and signed inspection records shall be kept on file and shall be readily available.

d. A sample load test and inspection form is included as Exhibit I, which appears at the end of this chapter. This form is intended to be a sample only and is not intended to be mandatory.

7.2.7.1 Cranes

In addition to the requirements of Section 7.2.6, “Frequent Inspections,” periodic inspections shall include the following:

a. Components for deformation, cracks, or corrosion.

b. Bolts, rivets, nuts, and pins for being loose or absent.

c. Sheaves and drums for cracks or wear.

d. Parts such as pins, bearings, shafts, gears, rollers, locking and clamping devices, bumpers, and stops for wear, cracks, or distortion.

e. Brake-system parts, linings, pawls, and latches for excessive wear.

f. Load, wind, and other indicators over their full range for any significant inaccuracies.

g. Gasoline, diesel, electric, or other power plants for improper performance or noncompliance with other applicable standards.

h. Chain-drive sprockets for excessive wear and chains for excessive stretch.

i. Electrical apparatus for signs of any deterioration of controllers, master switches, contacts, limit switches, and push-button stations (not limited to these items).

j. Hooks for damage from chemicals, deformation, cracks, or having more than 15 percent in excess of normal throat operating,
or more than 10 degree twist from the plane of the unbent hook (see Chapter 13 for additional hook requirements).

k. Hook retaining nuts or collars and pins, welds, or riveting used to secure the retaining members for soundness.

l. Nondestructive examination of hooks and of welds, bearings, or other suspect load-bearing parts when required by the inspector.

m. Testing of motion limit devices, which interrupt power or cause a warning to be activated, for proper performance (each motion shall be inched or operated at low speed into the limit device with no load on the crane).

n. Function labels for legibility.

7.2.7.2 Wire Rope

a. A qualified inspector shall inspect all ropes at least annually. This inspection shall include examination of the entire length of the rope, without detaching it from the hoist drum. More frequent intervals shall be determined by a qualified person and shall be based on such factors as expected rope life as determined by experience on the particular installation or similar installations, severity of environment, percentage of capacity lifts, frequency rates of operation, and exposure to shock loads. The qualified inspector shall carefully note any deterioration such as described below resulting in appreciable loss of original strength and determine whether further use of the rope constitutes an acceptable risk.

1. Reduction of rope size below nominal diameter, whether due to loss of core support, internal or external corrosion, or wear of outside wires (see Table 7-1).

2. The number and distribution or concentration of broken outside wires.

3. Worn outside wires.

4. Sections of rope that are normally hidden during inspection or maintenance procedures, such as parts passing over sheaves (these are points most subject to deterioration).

5. Corroded or broken wires at end connections.

b. All rope on cranes that have been idle for 1 month or more due to shutdown or storage shall be inspected before the crane is returned to service. A dated and signed report of the rope inspection, including results, shall be filed.

c. No precise rules can be given for determining the exact time to replace rope because many variables are involved. Safety in this respect depends largely on the use of good judgment by an appointed person in evaluating remaining strength in a used rope, after allowance for deterioration disclosed by inspection. Safety of rope operation depends on this remaining strength.

Conditions such as the following shall be sufficient reason for questioning rope safety and considering replacement:

1. In running ropes, 12 randomly distributed broken wires in one rope lay, or 4 broken wires in one strand in one rope lay.

2. Wear of one-third of the original diameter of outside individual wires.

3. Kinking, crushing, birdcaging, or any other damage resulting in distortion of the rope structure.

4. Evidence of heat damage from any cause.

5. Reductions from nominal diameter greater than those listed in Table 7-1.

d. Replacement rope and connections shall have a strength at least as great as the original rope and connections furnished by the crane manufacturer. Any deviation from the original size, grade, or construction shall be specified by a rope manufacturer, the crane manufacturer, or a qualified person.

e. Never use discarded rope for slings.

7.2.7.3 Chain (Welded Link)

a. Operate the crane under load in raising and lowering directions, and observe the operation
of the chain and sprockets. The chain should feed smoothly into and away from the sprockets.

b. If the chain binds, jumps, or is noisy, first see that it is clean and properly lubricated. If the trouble persists, inspect the chain and mating parts for wear, distortion, or other damage.

c. The chain should be cleaned before inspection. Examine visually for gouges, nicks, weld spatter, corrosion, and distorted links. Slacken the chain and move adjacent links to one side to inspect for wear at the contact points. If wear is observed or stretching is suspected, the chain should be measured according to the hoist manufacturer’s instructions. If instructions are not available, proceed as follows:

1. Select an unworn, unstretched length of the chain (e.g., at the slack end).

2. Suspend the chain vertically under tension and, using a caliper-type gauge, measure the outside length of any convenient number of links approximately 12 in. (305 mm) to 14 in. (356 mm) overall.

3. Measure the same number of links in the used sections and calculate the percentage of increase in length.

d. Conditions such as the following shall be sufficient reason for questioning safety and for considering replacement:

1. If the used chain exceeds a crane manufacturer’s recommended length or, in the absence of such a recommendation, the used chain is 1.5 percent longer than the unused chain for powered hoists or is 2.5 percent longer than the unused chain for hand-operated chain, replace the chain.

2. The existence of gouges, nicks, corrosion, weld spatter, or distorted links.

e. Repairing the load chain by welding or any other means shall not be attempted by anyone other than the chain manufacturer.

f. Replacement chain shall be the same size, grade, and construction as the original chain furnished by the crane manufacturer unless otherwise recommended by the manufacturer due to working conditions.

g. Load-chain links that pass over the load sprocket on edge (alternate to those that lie flat in the pockets) should be installed with the welds away from the center of the sprocket. This precaution is not required on idler sprockets.

h. The chain shall be installed without any twist between the hoist and an anchored end on either the loaded side or the slack side.

i. When a chain is replaced, disassemble and inspect the mating parts (sprockets, guides, stripper) for wear, and replace if necessary.

j. Discarded load chain shall not be used for slings.

### 7.2.7.4 Chain (Roller)

a. Test the crane under load in raising and lowering directions, observing the operation of the chain and sprockets. If the chain binds, jumps, or is noisy, clean and properly lubricate it. If the trouble persists, inspect the chain and mating parts for wear, distortion, or damage.

b. If wear is observed or stretching is suspected, the chain shall be measured according to the crane manufacturer’s instructions. If instructions are not available, proceed as follows:

<table>
<thead>
<tr>
<th>Rope diameter</th>
<th>Maximum allowable reduction from Nominal diameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>Up to 5/16 in. (8 mm)</td>
<td>1/64 in. (0.4 mm)</td>
</tr>
<tr>
<td>Over 5/16 in. to 1/2 in. (13 mm)</td>
<td>1/32 in. (0.8 mm)</td>
</tr>
<tr>
<td>Over 1/2 in. to 3/4 in. (19 mm)</td>
<td>3/64 in. (1.2 mm)</td>
</tr>
<tr>
<td>Over 3/4 in. to 1 1/8 in. (29 mm)</td>
<td>1/16 in. (1.6 mm)</td>
</tr>
<tr>
<td>Over 1 1/8 in. to 1 1/2 in. (38 mm)</td>
<td>3/32 in. (2.4 mm)</td>
</tr>
</tbody>
</table>
1. Suspend the hoist in normal position and apply a light load of approximately 50 lb (23 kg).

2. Select a 12-in. (305-mm) section of chain that normally travels over the load sprocket.

3. Determine elongation by measuring with a caliper from the edge of one chain pin to the corresponding edge of another pin. If elongation exceeds 1/4 in. (6.3 mm) in 12 in. (305 mm) compared to new or unstretched chain values, the chain shall be replaced.

4. Inspect for twist. Replace if the twist in any 5-ft (1.52-m) section exceeds 15 degrees.

5. Check for straightness in a plane perpendicular to the plane of the rollers. Replace if the chain has a bow exceeding 1/4 in. (6.3 mm) in any 5-ft (1.52-m) section.

6. Additional inspection shall be made by removing the chain from the crane and cleaning it thoroughly. Deficiencies such as those listed below shall be carefully examined and a determination shall be made as to whether they constitute a safety hazard:
   i. Pins turned from original position.
   ii. Rollers that do not run freely with light finger pressure.
   iii. Joints that cannot be flexed by easy hand pressure.
   iv. Side plates that are spread open.
   v. Corrosion, pitting, or discoloration.
   vi. Gouges, nicks, or weld spatter.

7.2.8 Cranes Not in Regular Service

a. Cranes that have been idle for 1 month or more but less than 6 months shall be inspected before being placed in service according to the requirements listed above in Section 7.2.6, “Frequent Inspection.”

b. Cranes that have been idle for 6 months or longer shall be inspected before being placed in service according to the requirements listed above in Section 7.2.7, “Periodic Inspection.”
7.3 TESTING

7.3.1 Operational Tests

a. Prior to initial use, all new, reinstalled, repaired, or modified cranes shall be tested by a designated person to ensure compliance with this chapter, including the following functions:

1. Lifting and lowering.
2. Trolley travel.
3. Bridge travel.
4. Locking, limiting, and indicating devices, if provided.
5. Limit switches/devices.

b. The trip setting of hoist-limit devices shall be determined by tests with an empty hook traveling at increasing speeds up to the maximum speed. The actuating mechanism of the upper-limit device shall be located so that it will trip the device under all conditions and in sufficient time to prevent contact of the hook or load block with any part of the trolley or crane.

7.3.2 Rated Load Test

a. Prior to initial use, all new or reinstalled cranes and cranes in which the load sustaining parts have been altered, modified, repaired, or replaced, or whose rated capacities have been affected shall be tested by or under the direction of a qualified inspector.

b. A written report confirming the rated load testing of the crane shall be furnished by the inspector.

c. Test loads shall not be less than 100 percent or more than 125 percent of the rated capacity, unless otherwise recommended by the manufacturer or a qualified person.

d. Testing shall consist of the following operations as minimum requirements:

1. Hoist the test load a sufficient distance to ensure that the load is supported by the crane and held by the hoist brakes. Personnel shall be kept clear of the test load while it is suspended.
2. Transport the test load by means of the trolley for the full length of the bridge.
3. Transport the test load by means of the bridge for the full length of the runway, in one direction with the trolley as close to the extreme right-hand end of the crane as practical, and in the other direction with the trolley as close to the extreme left-hand end of the crane as practical.
4. Lower the test load, stopping by the brakes.

b. The replacement of load chain and rope is specifically excluded from this requirement; however, an operational test of the crane shall be made in accordance with para. 7.3.1.a.1 prior to putting the crane back in service.

c. If wire rope clips or wedge socket end connection are installed during wire rope installation:

1. The crane should be cycled several times with a load equal to or greater than the maximum operational load, normally 100% of the rated capacity.
2. If wire rope clips are used, then check and retighten nuts to the wire rope clip or wire rope manufacturer’s recommended torque value.
3. If a wedge socket is used, then verify that the rope is properly seated.

d. Operational testing of altered, repaired, or modified cranes whose load sustaining parts or rated capacities have not been affected may be limited to the functions affected by the alteration, repair, or modification as determined by a qualified person.

h. The transporting of test loads as required by paragraph 7.3.2.a above, shall be done insofar as interfering equipment/structures permit and in accordance with recommendations from the manufacturer or a responsible engineering organization. However, test loads should not be carried over critical systems or components.

i. Test weights shall be accurate to within -5 percent, +0 percent of stipulated values.
7.4 MAINTENANCE

7.4.1 Operating Equipment

a. A preventive maintenance program shall be established and based on the recommendation of the crane manufacturer or a qualified person. Dated records should be kept where readily available to appointed personnel.

b. Replacement parts shall be at least equal to the original manufacturer’s specifications.

c. All moving parts of the crane for which lubrication is specified shall be regularly lubricated. Check lubricating systems for delivery of lubricant. Follow manufacturer’s recommendations as to points and frequency of lubrication, maintenance of lubricant levels, and types of lubricant to be used.

d. Maintenance personnel shall take the following precautions before performing maintenance on a crane:

1. Move the crane to a location where it will cause the least interference with other cranes and operations.

2. Place any attached loads on the ground or floor.

3. Place all controllers in the OFF position.

4. Perform a lockout/tagout procedure.

5. Use warning signs and barriers on the floor beneath the crane where overhead maintenance work creates a hazard.

6. If the runway remains energized, place stops or signalers full-time at a visual vantage point to observe the approach of active cranes and prohibit contact by the active cranes with the idle crane, with persons performing maintenance, or with the maintenance equipment.

7. Install a guard or barrier between adjacent runways for the length of the established work area to prevent contact between persons performing maintenance and any crane on the adjacent runway.

7.4.2 Wire-Rope Maintenance

Personnel using wire rope shall ensure proper care by doing the following:

a. Store rope to prevent damage or deterioration.

b. Unreel or uncoil rope as recommended by the rope manufacturer and with care to avoid kinking or inducing a twist.

c. Before cutting rope, use some method to reduce internal friction and prevent corrosion.

7. Install a guard or barrier between adjacent runways for the length of the established work area to prevent contact between persons performing maintenance and any crane on the adjacent runway.

Personnel using wire rope shall ensure proper care by doing the following:

a. Store rope to prevent damage or deterioration.

b. Unreel or uncoil rope as recommended by the rope manufacturer and with care to avoid kinking or inducing a twist.

c. Before cutting rope, use some method to prevent unlaking the strands. Heat affected zones of flame cut wire rope shall not be allowed to bear load.

d. During installation, avoid dragging the rope in dirt or around objects that will scrape, nick, crush, or induce sharp bends in it.

e. Maintain rope in a well-lubricated condition to reduce internal friction and prevent corrosion. Ensure that lubricant applied as part of a maintenance program is compatible with the original lubricant and is also a type that does not hinder visual inspection. Those sections of rope located over sheaves or otherwise hidden during inspection and maintenance procedures require special attention when the rope is being lubricated.
7.5 OPERATION

a. The following shall apply to all personnel involved in overhead and gantry crane operation.

b. At the initial stage of the planning process, an appointed person shall classify each lift into one of the DOE-specified lift categories (ordinary, critical, or preengineered production).

7.5.1 Conduct of Operator

a. Do not engage in any practice that will divert your attention while operating the crane.

b. Do not operate cranes without complying with the requirements of Chapter 6. Your immediate supervisor shall participate in this determination.

c. Operators shall be held directly responsible for the safe operation of their equipment. Whenever there is any question as to the safety of the activity, an operator has the authority to stop and refuse to handle loads until the matter has been resolved by supervisory personnel.

d. Sound a warning signal (if furnished) during travel, particularly when approaching personnel.

e. If you find the crane's main or emergency switch open when starting on duty, do not close it until it has been determined that no one is on or close to the crane. If there is a warning sign on the switch, do not remove it unless you placed it there. Do not close the switch until the warning sign has been removed by the person who placed it there.

f. Before closing the main switch, ensure that all controllers are in the OFF position.

g. If a power failure occurs during operation, immediately switch all controllers to the OFF position.

h. Become familiar with your equipment and its proper care. If adjustments or repairs are necessary, or any defects are known, report them promptly to the responsible supervisor. Also, notify the next operator of the defects at shift change.

i. Contacts with runway stops or other cranes shall be made with extreme caution. If you are ordered to engage with or push other cranes, do this with particular care for the safety of persons on or below the cranes, and only after making certain that any persons on the other cranes are aware of what action is to be taken.

j. Secure outdoor cranes before leaving them.

k. When the wind-indicating alarm is given, anchor the bridge on outside cranes.

l. Lock and tag the main positive electrical control switch in the OPEN position before any crane maintenance is performed.

m. Operate all controls before beginning a new shift. If any controls do not operate properly, adjust or repair them before operations begin.

n. Do not hoist two or more separately rigged loads in one lift, even though the combined load is within the crane's rated capacity.

o. Ensure that a 10BC or larger fire extinguisher is installed in the cab of cab-operated cranes. The extinguisher shall be maintained in a serviceable condition.

p. Do not lift, lower, or travel the crane while anyone is on the load or hook.

7.5.2 Hoist-Limit Switch/Device

a. At the beginning of each work shift, or the first time the crane is used during a shift, test the upper-limit switch/device of each hoist under no load. Exercise extreme care to avoid two-blocking; “inch” the block into the limit switch or run it in at slow speed. If the switch/device does not operate properly, immediately notify the supervisor.

b. If a lift is in progress during a shift change, this testing requirement is considered to have been satisfied for the completion of that lift. However, test the limit switch again before the next lift.

7.5.3 Standard Hand Signals

The standard hand signals for DOE use shall be as specified in the latest edition of the ASME B30 standards for the particular type of crane or hoist being used (see Figure 7-4).
Figure 7-4. Standard hand signals for controlling overhead crane operation.
### 7.5.4 Identification of Signalers

a. All personnel acting as signalers during crane operations shall be clearly identified to the crane operator by using the following (one or more, as required by the responsible manager): orange hardhat, orange gloves, and orange vest. This requirement may be waived by the responsible manager when the lift is very closely controlled or personnel are required to wear special clothing for protection from a hazardous environment.

b. In those cases where the crane operator cannot see the signaler, a second person (relay signaler) shall be stationed where he or she can see both the signaler and the crane operator and signals can be relayed to the operator. The relay signaler shall also be clearly identified by the items described in the previous paragraph.

c. Where voice (direct or two-way radio) communication is used, the signaler shall communicate directly with the operator, not through a third person.

d. The operator shall obey signals only from the designated signaler. *Obey a STOP signal no matter who gives it.*

### 7.5.5 Size of Load

a. The weight of the load shall be determined prior to making the lift.

b. The crane and rigging equipment shall not be loaded beyond its rated capacity, except for authorized testing described in Section 7.3.

d. Cranes shall not be used for side pulls except when specifically authorized by an appointed person who has determined that the stability of the crane is not endangered and that load-bearing parts of the crane will not be overstressed.

e. Avoid carrying loads above people.

### 7.5.6 Attaching the Load

a. Ensure that the hoist rope is free from kinks or twists. Do not wrap the hoist rope around the load.

b. Ensure the load is attached to the load-block hook by means of slings or other approved devices.

c. Take care to make certain that the sling clears all obstacles.

d. The person appointed to direct the lift shall see that the load is well secured and properly balanced in the sling or lifting device before it is lifted more than a few inches.

### 7.5.7 Moving the Load

a. Before starting to hoist, note the following conditions:

1. Hoist rope shall not be kinked.

2. Multiple-part lines shall not be twisted around each other.

3. The hook shall be positioned above the center of gravity of the load in such a manner as to minimize swinging when the load is lifted.

4. If there is a slack-rope condition, it should be determined that the rope is properly seated on the drum and in the sheaves.

5. All personnel including the qualified rigger shall be clear of the load.

c. During hoisting, take care to ensure that:

1. The load is lifted slowly until it clears the ground or other support to minimize swinging.

2. There is no sudden acceleration or deceleration of the moving load.

3. The load does not contact any obstructions. A “dry run” shall be conducted in areas where clearance is limited.

d. Each time a load approaching the rated capacity is handled, test the hoist brakes by raising the load a few inches and applying the brakes. Any slippage or downward motion is unacceptable.
g. Do not lower the hook below the point where less than two full wraps of rope remain on the hoisting drum.

h. When the load or hook approaches personnel, sound the warning signal.

i. Tag lines should be used as required to guide, snub, or otherwise control the load.

j. Place any attached load on the ground or floor, place controls in the OFF position, and turn off the power source before leaving the crane unattended, unless required to do otherwise by an approved emergency procedure.

k. Work on suspended loads is prohibited under normal conditions. If the responsible manager decides that it is necessary to work on a suspended load, guidelines for safe operation shall be established through consultation with the appropriate safety organization. Suspended loads that must be worked on shall be secured against unwanted movement.

7.5.8 Ordinary Lifts

a. The requirements of all preceding paragraphs in Section 7.5, “Operation,” also shall apply to ordinary lifts.

b. An appointed person shall classify each lift into one of the DOE categories (ordinary, critical, or preengineered production) before the lift is planned.

c. Hoisting and rigging operations for ordinary lifts require a designated leader who shall be present at the lift site during the entire lifting operation. If the lift is being made by only one person, that person assumes all responsibilities of the designated leader.

d. Leadership designation may be by written instructions, specific verbal instructions for the particular job, or clearly defined responsibilities within the crew’s organizational structure.

e. The designated leader’s responsibility shall include the following:

1. Ensure that personnel involved understand how the lift is to be made.

2. Ensure that the weight of the load is determined, that proper equipment and accessories are selected, and that rated capacity is not exceeded.

3. Survey the lift site for hazardous/unsafe conditions.

4. Ensure that equipment is properly set up and positioned.

5. Ensure that a signaler is assigned, if required, and is identified to the operator.

6. Direct the lifting operation to ensure that the job is done safely and efficiently.

7. Stop the job when any potentially unsafe condition is recognized.

8. Direct operations if an accident or injury occurs.

f. The operator, or a designated person, shall ensure that the crane is still within the inspection interval.

g. The operator, or a designated person, shall visually examine the crane in accordance with Section 7.2.4.

7.5.9 Critical Lifts

Exhibit I is intended to be a sample form only and is not mandatory. Any other form that accomplishes the purpose is acceptable.

REMARKS (Unusual conditions—noises, structural cracks, misalignment, etc.)
BRIDGE CRANE AND FOLLOW UP CHECKS

NOTES: 1. Craftsmen shall initial all steps completed below.

2. Qualified inspector shall verify all steps below.

3. Load test shall be performed on all new, repaired, or modified cranes prior to initial use.

4. Load test crane at 125% of rated capacity. In no case shall the load test exceed 125% of rated capacity. Test weights shall be accurate to -5%, + 0% of stipulated values.

INITIAL

1. Set crane up for load test and qualified inspector verify inspection is complete prior to load test.

2. The trip setting of hoist-limit devices shall be determined by tests, with an empty hook traveling at increasing speeds up to the maximum speed. The actuating mechanism of the limit device shall be located so that it will trip the device under all conditions and in sufficient time to prevent contact of the hook or load block with any part of the trolley or crane.

3. Rig test weight to hoist hook using appropriate slings.

4. Hoist the test load a sufficient distance to ensure that the load is supported by the crane and held by the hoist brakes.

5. Transport the test load by means of the trolley for the full length of the bridge. Ensure during operation that the trolley runs true on the bridge. Check trolley motor, brake, and gear case for overheating.

6. Transport the test load by means of the bridge for the full length of the runway, first in one direction with the trolley as close to the extreme right-hand end of the crane as practical and next in the other direction with the trolley as close to the extreme left-hand end of the crane as practical. Ensure that the bridge runs true on the runway rails and that no undue girder deflection occurs. Check for bridge motor, brake, and gear-case overheating.

7. Move the test load back into the original position and lower the test load, stopping by the brakes. Hold the load for 10 min or the time required to check all primary load-bearing parts while under load for slippage, damage, or permanent deformation.

8. Slowly lower the test load to the floor.

9. At the completion of the load test, visually inspect the following load-bearing parts for signs of wear, deformation, and deterioration:
DEFECTIVE/OK

a. Bridge track
b. Bridge wheels
c. Trolley track
d. Trolley wheels
e. Gears
f. Magnetic brakes
g. Blocks.

Visually inspect rope in accordance with Chapter 11, “Wire Rope and Slings.”

a. Rope diameter:  (Previous) (Present)
b. Wear
c. Kinks
d. Broken wires
e. Other signs of deterioration.

Visually inspect the rope drum for:

a. Wear
b. Deformation
c. Deterioration.

INITIAL

10. Qualified inspector shall perform nondestructive tests on hook by visual examination, liquid penetrant examination, or magnetic-particle examination. Acceptance: No cracks, linear indications, laps, or seams.

Hooks with more than 15% normal (new hook) throat opening shall be replaced. Hooks with more than 10 degree twist from the normal (new hook) plane of the hook shall be replaced. Hooks having more than 10% wear in the throat section or 5% elongation of the shank shall be replaced. Lubricate hook bearing and latch pin as applicable.

Establish three marks, A, B, and C, with a center punch. For ease in measuring, set distances on an even number of inches.
BEFORE LOAD TEST

Length AB _______ in.

Length BC _______ in.

AFTER LOAD TEST

Length AB _______ in.

Length BC _______ in.

Check for:

1. Wear and deformation
2. Cracks and twisting
3. Signs of opening between Point A and Point B

Exhibit I  Hoist Load Test and Inspection .......................... 8-19
8.1 GENERAL

a. Hoists described in this chapter include hand-powered, air-powered, and electric-powered hoists that are not permanently mounted on overhead cranes.

b. This chapter applies to the following types of equipment (see Figures 8-1 through 8-6):
   1. Overhead hoists (underhung).
   2. Jib cranes/hoists (floor and wall mounted).
   3. Monorail systems.
   c. Wire-rope ratchet and pawl lever-operated hoists should not be used for lifting service (see Figure 8-8).
   d. Systems used for transporting personnel and specially insulated hoists used for handling electrically energized power lines require special considerations and are not included in this chapter.

Figure 8-1. Hand-chain-operated hoists.

Figure 8-2. Electric/air-powered chain and wire-rope hoists.
Figure 8-3. Electric/air-powered wire-rope hoists.

Figure 8-4. Manual-lever-operated hoist—chain type.

Figure 8-5. Manual-lever-operated hoist—wire-rope type.
Figure 8-6. Manual-lever-operated hoist—web-strap type.

Figure 8-7. Recommended—hoists with friction brake type load-controlling mechanisms.

Figure 8-8. Not recommended—hoists with ratchet and pawl load-controlling mechanisms.
8.1.1 Operator Training/Qualification

Hoist operators shall be trained and qualified according to requirements found in Chapter 6, “Personnel Qualification and Training.”

8.1.2 Marking

a. The rated capacity shall be permanently marked on the hoist or load block.

b. Electric-powered hoists shall be marked with:
   1. Name of manufacturer.
   2. Manufacturer's model or serial number.
   3. Voltage of AC or DC power supply and phase/frequency of AC power supply.

c. Air-powered hoists shall be marked with:
   1. Name of manufacturer.
   2. Manufacturer's model or serial number.
   3. Rated air pressure.

d. Hand-chain-operated hoists shall be marked with:
   1. Name of manufacturer.
   2. Manufacturer's model or serial number.

     3. Manual-lever-operated hoists shall be marked with:
        1. Name of manufacturer.
        2. Manufacturer's model or serial number.

8.1.3 Warning Labels

Documented evidence of equivalent training of the user of the hoist, demonstrating that the information on the warning labels has been conveyed and understood by the user, will waive the requirement to maintain warning labels.

8.1.3.1 Electric- or Air-Powered Hoists

a. Labels shall be affixed to the hoist, load block, or controls that display the word WARNING or other legend designed to bring the label to the attention of an operator.

b. The label shall contain cautionary language against any of the following:
   1. Lifting more than the rated load.
   2. Operating a hoist when the load is not centered under the hoist.
   3. Operating a hoist with twisted, kinked, or damaged chain or wire rope.
   4. Operating a damaged or malfunctioning hoist.
   5. Lifting personnel or lifting loads above personnel.
   6. Operating a wire-rope hoist with a wire rope that is not properly seated in its grooves.
   7. Removing or obscuring warning labels.

8.1.3.2 Hand-Chain-Operated or Manual-Lever-Operated Hoists

a. Labels shall be affixed to the hoist or load block and shall display the word WARNING or other legend designed to bring the label to the attention of an operator.

b. The label shall contain cautionary language against any of the following:
   1. Lifting more than the rated load.
   2. Operating a hoist when it is restricted from forming a straight line with the direction of loading.
   3. Operating the hoist with twisted, kinked, or damaged wire rope, chain, or webbing strap.
   4. Operating damaged or malfunctioning hoists.
5. Lifting personnel or lifting loads above personnel.

6. Operating a hoist with lever extensions (for lever-operated hoists).

7. Operating hoists with other than manual power (for hand-chain-operated hoists).

8. Removing or obscuring warning labels.

8.1.4 Design Standards

a. At a minimum, safety features and operation shall meet the provisions of ASME B30.16 and B30.21.

8.1.5 Design Factors

a. For electric- or air-powered hoists, load-suspending parts of powered hoists shall be designed so that the static stress calculated for the rated load will not exceed 20 percent of the average ultimate material strength. This requirement is commonly reflected by quoting a minimum design factor of 5:1.

b. For hand-chain-operated and manual-lever-operated hoists, load-suspending parts shall be designed so that the static stress calculated for the rated load will not exceed 25 percent of the average ultimate strength. This requirement is commonly reflected by quoting a minimum design factor of 4:1.

8.1.6 Load-Braking/Load-Controlling Mechanisms

8.1.6.1 Electric-Powered Hoists

a. Under normal operating conditions with rated load and under test conditions with test loads up to 125 percent of rated load, the braking system shall perform the following functions:

1. Stop and hold the load hook when controls are released.

2. Limit the speed of the load during lowering, with or without power, to a maximum of 120 percent of the rated lowering speed for the load being handled.

3. Stop and hold the load hook in the event of a complete power failure.

b. The braking system shall have thermal capacity for the frequency of operation required by the service.

c. The braking system shall have provision for adjustments, where necessary, to compensate for wear.

8.1.6.2 Air-Powered Hoists

a. Under normal operating conditions with rated load and under test conditions with test loads up to 125 percent of rated load, the braking system shall perform the following functions:

1. Stop and hold the load hook when controls are released.

2. Prevent an uncontrolled lowering of the load in the event of a loss of air pressure.

b. The braking system shall have thermal capacity for the frequency of operation required by the service.

c. The braking system shall have provision for adjustments, where necessary, to compensate for wear.
8.1.6.3 **Hand-Chain-Operated Hoists**

The hoist shall be designed so that when the actuating force is removed, it will automatically stop and hold any test load up to 125 percent of the rated load.

8.1.6.4 **Manual-Lever-Operated Hoists**

a. The hoist shall be equipped with a load-controlling mechanism.

b. The load-controlling mechanism shall perform the following functions under normal operating conditions with test loads up to 125 percent of rated capacity:
   1. Stop and hold the load when the lever force is removed and the lever stroke is completed.
   2. Provide for incremental movement of the load when lifting or lowering.

c. The friction brake mechanism shall have provision for adjustment where necessary to compensate for wear.

8.1.7 **Wire Rope**

a. Wire rope shall be of a construction specified by the hoist manufacturer or by a qualified person.

b. If a load is supported by more than one part of wire rope, the tension on the parts shall be equalized.

c. Socketing shall be done in the manner specified by the manufacturer of the assembly or the rope.

d. Eye splices shall be made in a manner recommended by a qualified person. Rope thimbles should be used in the eye.

e. Swaged or compressed fittings shall be applied as recommended by the rope, hoist, or fitting manufacturer or a qualified person.

f. Use rope having an independent wire-rope, wire-strand core, or other temperature-damage-resistant core if the rope will be exposed to ambient temperatures greater than 180 degrees F (82 degrees C).

g. The rope ends should be attached to the hoist in a manner to prevent disengagement throughout rated hook travel. No less than two wraps of rope shall remain on the anchorage of the hoist load sprocket (drum) when the hook is in its fully extended position, unless a lower-limit device is provided, in which case one wrap shall remain on each anchorage of the drum hoist.

8.1.8 **Load Chain**

8.1.8.1 **Electric-Powered, Air-Powered, and Manual-Lever-Operated Hoists**

a. Load chain may be either roller or welded link type (see Figure 8-9). Chain shall be pitched (calibrated) so as to pass over all load sprockets without binding.

![Figure 8-9. Load chain.](image)

b. The load chain shall be proof-tested by the chain or hoist manufacturer with a load at least equivalent to 1.5 times the hoist’s rated load divided by the number of chain parts supporting the load.

c. If a load is supported by more than one part of load chain, the tension on the parts shall be equalized.

8.1.8.2 **Hand-Chain-Operated Hoists**

a. The hand chain shall be of a shape and pitch to fit the hand-chain wheel without binding or jamming under normal operating conditions.
b. The hand chain shall be guarded to prevent disengagement from the hand-chain wheel.

c. The hand chain shall withstand, without permanent distortion, a force of three times the pull required to lift the rated load.

8.1.9 Web Strap

The following applies for manual-lever-operated hoists:

a. Web strap should be nylon, polyester, or similar synthetic material.

b. If a load is supported by more than one part of web strap, the tension on the parts shall be equalized.

c. End terminations shall be done in the manner specified by the manufacturer of the assembly or the web strap.

d. Eyes shall be made in a manner recommended by the hoist manufacturer or a qualified person.

e. Nylon and polyester web straps shall not be exposed to an ambient temperature greater than 200 degrees F (93 degrees C).

f. The web strap shall be attached to the hoist in a manner to prevent disengagement throughout rated hook travel; no less than two wraps of web strap shall remain on the hoist load sprocket (drum) when the hook is extended to its full rated lift.

8.1.10 Overtravel Protection

8.1.10.1 Upper-Limit Switches/Devices

For electric- or air-powered hoists, the hoist shall be designed and constructed so that the load hook, either loaded or empty, shall not exceed the upper limit of travel. In lieu of a limit switch, a mechanism such as a slip clutch may be used.

8.1.10.2 Lower-Limit Switches/Devices

a. For electric- or air-powered hoists, the hoist shall not be installed where, during normal operating conditions, the hook can be lowered beyond rated hook travel unless the hoist is equipped with a lower-limit device. Lower-limit devices should be provided for hoists where the load block enters pits or hatchways in the floor.

b. For hand-chain-operated and manual-lever-operated hoists, before the load chain can be completely run out of the hoist, it shall be restrained in its fully extended position. The restraint shall be such that the unloaded hoist can withstand a lowering hand chain or operating lever force equivalent to twice the pull required to lift the rated load, or with the rated load on the hoist, a hand chain or operating lever force equivalent to the pull required to lift the rated load.

8.1.11 Travel Warning Devices

On cab- and remote-operated carriers, an audible or visual warning means shall be provided, unless it is impossible for personnel to work on the floor below the hoist.

8.1.12 Support

Support structures, including trolleys and monorails, shall have a rated capacity at least equal to that of the hoist.

8.1.13 Location

The hoist shall be installed only in locations that will permit the operator to remain clear of the load at all times.

8.1.14 Load Rating

The rated capacity shall not be exceeded except for properly authorized tests.
8.2 INSPECTIONS

8.2.1 Hoist Service

Hoist service is defined as follows:

a. Normal service—operation with randomly distributed loads within the rated load limit, or uniform loads less than 65 percent of rated load for not more than 15 percent of the time for manual-lever-operated hoists or for not more than 25 percent of the time for electric- or air-powered hoists.

b. Heavy service—operation within the rated capacity that exceeds normal service.

c. Severe service—operating at normal or heavy service under abnormal operating conditions, (i.e., extreme temperatures, corrosive atmospheres).

8.2.2 Initial Inspection

Prior to their initial use, all new, repaired, or modified hoists shall be inspected by a qualified inspector to ensure compliance with the applicable provisions of ASME B30.11, B30.16, and B30.21. Dated and signed inspection records shall be kept on file and shall be readily available.

8.2.3 Daily Inspection

a. Operators or other designated personnel shall visually inspect items such as the following at the beginning of each shift or prior to first use if the hoist has not been in regular service (records are not required):

1. Controls and operating mechanisms for proper operation.

2. Hoist upper-limit switch, as applicable, for proper operation.

3. Lines, valves, and other parts of air systems for leakage.

4. Hooks for cracks, deformation, and damage from chemicals (see Chapter 13, “Load Hooks,” for additional hook requirements).

5. Hoist rope for kinking, crushing, birdcaging, and corrosion.

6. Hoist chain for nicks, gouges, distortion, wear, cracks, and corrosion.

7. Synthetic web strap for abrasive wear, knots, cuts, or tears, broken stitching, acid or caustic burns, melting or charring, or weld splatter.

8. Hook latch, if used, for proper operation.

b. Operators or other designated personnel shall examine deficiencies and determine whether they constitute a safety hazard.

8.2.4 Frequent Inspection

a. Operators or other designated personnel shall visually inspect the hoist at the following intervals (records are not required):

1. Normal service—monthly.

2. Heavy service—weekly to monthly.

3. Severe service—daily to weekly.

b. In addition to the requirements listed above in Daily Inspection, these inspections shall include the following:

1. Hoist braking system for proper operation.

2. Hoist rope or chain reeving for compliance with hoist manufacturer’s recommendations.

3. Lever for bends, cracks, and the like

4. Observations during operation.

C. Examine deficiencies and determine whether a more detailed inspection is required.

8.2.5 Periodic Inspection

a. A qualified inspector shall perform a complete inspection at the following intervals:
1. Normal service—yearly.
2. Heavy service—semiannually.

b. The qualified inspector shall examine deficiencies and determine whether they constitute a safety hazard and whether disassembly is required.

c. Dated and signed inspection records shall be kept on file and shall be readily available.

d. A sample load test and inspection form is included as Exhibit I, which appears at the end of this chapter. This form is intended to be a sample only and is not intended to be mandatory.

8.2.5.1 Hoists

a. In addition to the requirements listed in Section 8.2.4, “Frequent Inspection,” periodic inspections of hoists shall include the following:

1. Loose fasteners.
2. Cracked or worn drums or sheaves.
3. Worn, corroded, cracked, or distorted parts such as pins, bearings, shafts, gears, rollers locking, and clamping devices.
4. Excessive wear on motor or load brakes.
5. Excessive wear of chains, ropes, synthetic web strap, load sprockets, drums, sheaves, and chain stretch.
6. Deterioration or damage of end connections and terminations of wire rope, load chains, and synthetic web.
7. Hooks having more than 15 percent in excess of normal throat opening, or more than 10 degree twist from the plane of the unbent hook (see Chapter 13 for additional hook requirements).
8. Hook-retaining nuts or collars and pins, welds, or riveting used to secure the retaining members.
9. Suitable crack-detecting inspections for hooks, such as dye-penetrant or magnetic-particle inspections (performed when required by the inspector).
10. Electrical apparatus for signs of pitting or any deterioration of controller contactors, limit switches, and push-button switches.
11. Supporting structures and trolleys, if used, for continued ability to support the imposed loads.
12. Warning labels for illegibility or absence.

8.2.5.2 Wire Rope

a. A qualified inspector shall inspect running rope at least annually. This inspection shall include examination of the entire length of rope, without detaching it from the hoist drum. More frequent intervals shall be determined by a qualified person and shall be based on such factors as expected rope life as determined by experience on the particular installation or similar installations, severity of environment, percentage of capacity lifts, frequency rates of operation, and exposure to shock loads. The qualified inspector shall carefully note any deterioration, such as described below, resulting in appreciable loss of original strength and determine whether further use of the rope constitutes an acceptable risk.

1. Reduction of rope size below nominal diameter, whether due to loss of core support, internal or external corrosion, or wear of outside wires (see Table 8-1).
2. A number of broken outside wires and the distribution or concentration of such broken wires.
3. Worn outside wires.
4. Sections of rope that are normally hidden during inspection or maintenance procedures, such as parts passing over sheaves (these are points most subject to deterioration).
5. Corroded or broken wires at end connections.
6. Corroded, cracked, bent, worn, or improperly applied end connections.
7. Kinking, crushing, cutting, or unstranding.

<table>
<thead>

</tbody>
</table>

d. The qualified inspector shall give special attention to end fastenings and shall examine ropes frequently at socketed fittings; on the development of two broken wires adjacent to this point, resocket or replace the rope. Resocketing shall not be attempted if the resulting rope length will be insufficient for proper operation. Those portions of the rope subjected to reverse bends and operation over small-diameter drums or sheaves shall be closely examined.

e. Replacement rope and connections shall have a strength rating at least as great as the original rope and connections furnished by the hoist manufacturer. Any deviation from the original size, grade, or construction shall be specified by a rope manufacturer, the hoist manufacturer, or a qualified person.

f. Never use discarded rope for slings.

8.2.5.3 Welded-Link Chain

a. A qualified inspector shall do the following during periodic inspections:

1. Operate the hoist under load in raising and lowering directions, and observe the operation of the chain and sprockets. The chain should feed smoothly into and away from the sprockets.

2. Make sure that, if the chain binds, jumps, or is noisy, first clean and properly lubricate it. If the trouble persists, inspect the chain and mating parts for wear, distortion, or other damage.

3. The chain should be cleaned before inspection. Examine visually for cracks, gouges, nicks, weld spatter, corrosion, and distorted links. Slacken the chain and move adjacent links to one side to inspect for wear at the contact points. If you observe wear or suspect stretching, measure the chain according to the hoist manufacturer's instructions. If instructions are not available, proceed as follows:

   i. Select an unworn, unstretched length of the chain (e.g., at the slack end).

   ii. Suspend the chain vertically under tension and, using a
caliper-type gauge, measure the outside length of any convenient number of links approximately 12 in. (305 mm) to 14 in. (356 mm) overall.

iii. Measure the same number of links in the used sections and calculate the percentage of increase in length.

iv. If the used chain exceeds a hoist manufacturer's recommended length, or in the absence of such a recommendation, if the used chain is 1.5 percent longer than the unused chain for powered hoists or is 2.5 percent longer than the unused chain for hand-operated hoists, replace the chain.

v. Examine the chain for gouges, nicks, corrosion, weld spatter, or distorted links. Any of these conditions shall be sufficient reason for questioning safety and considering replacement. Safety in this respect depends largely on the use of good judgment by an appointed person in evaluating the degree of damage.

4. No one except the chain manufacturer shall repair the load chain by welding or any other means.

5. Ensure that replacement chain is the same size, grade, and construction as the original chain furnished by the hoist manufacturer, unless otherwise recommended by the hoist manufacturer due to working conditions.

6. Load-chain links that pass over the hoist-load sprocket on edge (alternate to those that lie flat in the pockets) should be installed with the welds away from the center of the sprocket. This precaution is not required on idler sprockets, which change the direction but not the tension in the chain.

7. Ensure that replacement chain is installed without any twist between the hoist and an anchored end on either the loaded side or the slack side.

8. When a chain is replaced, disassemble and inspect the mating parts (sprockets, guides, stripper) for wear, and replace if necessary.

8.2.5.4 Roller Chain

a. A qualified inspector shall do the following during periodic inspections:

1. Test the hoist under load in raising and lowering directions, observing the operation of the chain and sprockets. If the chain binds, jumps, or is noisy, clean and properly lubricate it. If the trouble persists, inspect the chain and mating parts for wear, distortion, or damage.

2. If you observe wear or suspect stretching, measure the chain according to the hoist manufacturer's instructions. If instructions are not available, proceed as follows:

   i. Suspend the hoist in normal position and apply a light load of approximately 100 lb (46 kg).

   ii. Select a 12-in. (305-mm) section of chain that normally travels over the load sprocket.

   iii. Determine elongation by measuring with a caliper from the edge of one chain pin to the corresponding edge of another pin. If elongation exceeds 1/4 in. (6.3 mm) in 12 in. (305 mm) compared to new or unstretched chain values, replace the chain.

   iv. Inspect for twists. Replace if the twist in any 5-ft (1.52-m) section exceeds 15 degrees.

   v. Check for straightness in a plane perpendicular to the plane of the rollers. Replace if the chain has a bow exceeding 1/4 in. (6.3 mm) in any 5-ft (1.52-m) section.

3. Make additional inspections by removing the chain from the hoist and cleaning it thoroughly. Carefully examine deficiencies.
such as those listed below and determine whether they constitute a safety hazard. Any deficiencies are reason for questioning chain safety and considering its replacement.

i. Pins turned from original position.

ii. Rollers that do not run freely with light finger pressure.

iii. Joints that cannot be flexed by easy hand pressure.

iv. Side plates that are spread open.

v. Corrosion, pitting, or discoloration.

vi. Gouges, nicks, or weld spatter.

4. Do not attempt to repair roller chain by welding or heating.

5. Ensure that replacement chain is the same size, grade, and construction as the original chain furnished by the hoist manufacturer unless otherwise recommended by the hoist manufacturer due to working conditions.

6. Never use discarded or new roller chain for slings.

8.2.5.5 Synthetic-Web Strap

a. No precise rules can be given for determining the exact time to replace web strap. Safety depends largely on the use of good judgment by an appointed person in evaluating remaining strength in a used web, after allowance for deterioration disclosed by inspection.

b. Conditions such as the following shall be reason for questioning continued use of the web strap or increasing the frequency of inspection:

1. Severely worn end connections.

2. Distortion of the web-strap structure.

3. Evidence of any heat damage.

4. Evidence of any heat damage.

5. Cuts or tears.

6. Damaged eyes or fittings.

7. Abrasive wear.

8. Knots.

8.2.6 Hoists Not in Regular Service

a. A hoist that is not in regular service (idle for a period of 1 month or more, but less than 1 year) shall be inspected before being placed in service according to the requirements listed above in Section 8.2.5, “Frequent Inspection.”

b. A hoist that is not in regular service (idle for a period of 1 year or more) shall be inspected before being placed in service according to the requirements listed above in Section 8.2.6, “Periodic Inspection.”
8.3 TESTING

8.3.1 Operational Tests

All new hoists shall be tested by the hoist manufacturer. All modified or repaired hoists or hoists that have not been used within the preceding 12 months shall be tested before being placed in service. All tests shall be done by a qualified inspector or under the direction of that inspector as detailed in the following paragraphs.

8.3.1.1 Electric- or Air-Powered Hoists

a. Check lifting and lowering (testing through complete rated lift length is not required).

b. Check operation of brakes.

c. Determine the trip-setting of limit devices by tests under no-load conditions. Conduct tests first by hand, if practical, and then under slowest speed obtainable. Test with increasing speeds up to maximum speed.

8.3.1.2 Hand-Chain-Operated Hoists

a. Check all functions of the hoist, including lifting and lowering, with the hoist suspended in an unloaded state.

b. After testing unloaded, apply a load of at least 50 lb (23 kg) multiplied by the number of load-supporting parts of chain to the hoist to check proper load control.

8.3.1.3 Manual-Lever-Operated Hoists

a. Check all functions of the hoist with the hoist suspended in an unloaded state.

b. After testing unloaded, apply a load of at least 100 lb (46 kg) multiplied by the number of load-supporting parts of load line to the hoist to check proper load control.

8.3.2 Proof-Load Test

Test anchorages or suspensions shall be approved by a qualified person.

8.3.2.1 Electric- or Air-Powered Hoists

a. The manufacturer shall dynamically test new hoists as specified in Section 8.3.1.1 (“Electric- or Air-Powered Hoists”), steps a. and b., with a test load of at least 125 percent of the rated load. If the manufacturer cannot test the hoist, the user shall be notified and the test shall be accomplished at another location or job site by a qualified inspector or under the direction of that inspector.

b. A qualified inspector shall test hoists in which load suspension parts have been modified, replaced, or repaired as specified in Section 8.3.1.1, steps a. and b. by or under the direction of a qualified inspector, and a record of the test shall be made. A designated or authorized person shall determine if repairs made to a hoist are extensive, and require a rated load test, or routine maintenance and require only an operational test. The applied test load shall not be less than 100 percent of the rated capacity of the hoist, or more than 125 percent of the rated capacity of the hoist unless otherwise recommended by the manufacturer or a qualified person. The replacement of load chain and rope is specifically excluded from this hoist test; however, a functional test of the hoist under a normal operating load should be made in accordance with 8.3.1., “Operational Tests,” prior to putting the hoist back in service.

8.3.2.2 Hand-Chain-Operated or Manual-Lever-Operated Hoists

a. The manufacturer shall dynamically test new hoists with a test load of at least 125 percent of the rated capacity. If the manufacturer cannot test the hoist, the user shall be notified and the test shall be accomplished at another location or job site by a qualified inspector or under the direction of that inspector.

b. Hoists in which load suspension parts have been modified, replaced, or repaired shall be tested statically or dynamically by or under the direction of a qualified inspector, and a record of the test should be kept. A designated or authorized person shall determine if repairs made to a hoist are extensive and require a rated load test or are routine maintenance and require only an operational test. The applied test load shall not be less than 100 percent of the rated capacity of the hoist or more than 125 percent of the rated capacity of the hoist, unless otherwise recommended by the manufacturer or a qualified person. The replacement of load chain is specifically excluded from this hoist load test; however, a functional test of the hoist should be made in accordance with Section 8.3.1.2 or 8.3.1.3 (“Hand-Chain-Operated Hoists” and “Manually Lever-Operated Hoists,” respectively), prior to putting the hoist back in service.

8.4 MAINTENANCE

a. A preventive maintenance program shall be established and be based on the hoist manufacturer’s recommendations.

b. Replacement parts shall be at least equal to the original manufacturer’s specifications.
8.5 OPERATION

a. The following shall apply to all personnel involved in hoist operations.

b. At the initial stage of the planning process, an appointed person shall classify each lift into one of the DOE-specified categories (ordinary, critical, or preengineered production).

8.5.1 Conduct of Operator

a. Do not engage in any practice that will divert your attention while engaged in operating the hoist.

b. Do not operate equipment if you are physically or mentally unfit.

c. Familiarize yourself with the equipment and its proper care. If adjustments or repairs are necessary or any damage is known or suspected, report it promptly to the appointed person. Notify the next operator of the problem upon changing shifts. Correct deficiencies before resuming normal operation.

d. Test all controls before beginning a shift. If any controls do not operate properly, adjust or repair them before beginning operations.

e. Operators are responsible for those operations under their direct control. Whenever there is doubt as to safety, consult with responsible management before handling the load.

f. Do not operate a hoist that bears an out-of-order sign or is otherwise tagged out-of-service.

g. If there is a tag, sign, or lock on electric- or air-powered equipment, do not energize the equipment until the tag, sign, or lock is removed by the person who placed it there or by an authorized person.

h. Do not close the main line disconnect device on powered equipment until you are certain that no one is on or adjacent to the hoist or carrier.

8.5.2 Size of Load

Know the weight of the load and do not load the hoist beyond the rated capacity, except as provided for in Section 8.3, “Testing.”

8.5.3 Attaching the Load

a. The supporting structure or anchoring means shall have a load rating at least equal to that of the hoist.

b. Use hoists only in areas that will allow you to be clear of the load.

c. Do not wrap the hoist rope or chain around the load.

d. Attach the load to the hook using slings or other approved devices.

e. Do not use chain or wire rope as a ground for welding.

f. Do not touch a welding electrode to the chain, wire rope, or any other part of the hoist or monorail system.

g. Operate hand-chain-operated hoists with hand power only and with no more than one operator per hand chain.

h. Do not use a lever extension (“cheater”) on manual-lever-operated hoists.

i. Properly seat the slings or other approved devices in the saddle of the hook before carrying out hoisting operations.

8.5.4 Moving the Load

a. Take care in hoisting to be certain that:

1. Hoist ropes or chains are not kinked or twisted.

2. The load does not contact any obstructions.

3. Multiple-part ropes or chains are not twisted around each other.

b. Before starting to hoist, ensure that the rope or chain is properly seated on the drum, sheaves, or sprockets.

c. Before starting the hoist, be certain that all personnel are clear of the equipment.

d. Do not operate hoists until the hook is positioned above the center of gravity of the
load, except when specifically authorized by an appointed person who has determined that the components of the hoist and its mounting will not be overstressed.

e. Do not move or lift a load more than a few inches until it is well balanced in a sling or lifting device.

f. Do not lift, lower, or travel the hoist while anyone is on the load or hook.

g. Avoid carrying loads above personnel.

h. Test the brakes each time a load approaching the rated capacity is handled by raising the load just enough to clear the floor or supports and checking for brake action. Continue the lift only after you are sure that the braking system is operating properly.

i. Do not lower a loaded wire-rope hoist drum beyond the point where less than two full wraps of wire rope remain on the drum.

j. Inch the hoist into engagement with a load, and avoid unnecessary stops and starts.

k. Do not perform side pulls with hoists except as specifically authorized by a qualified person.

l. If power goes off during operation of cab-operated equipment, immediately place all controllers in the OFF position. Before reuse, check operating motions for proper direction.

m. Do not leave a suspended load unattended unless specific precautions have been instituted and are in place.

n. Tag lines should be used as required to guide, snub, or otherwise control the load.

o. Take signals from only one person using the standard hand signals shown in Chapter 7, “Overhead and Gantry Cranes.” Obey a STOP signal regardless of who gives it.

p. Lift the hoist load block above head level for storage when the equipment is not in use.

8.5.5 Hoist-Limit Switch

a. At the beginning of a shift, test the upper-limit switch of each hoist under no load conditions. If the hoist has a lower-limit switch, test it with no load before lowering any load that could bring the lower-limit switch into operation. Exercise extreme care; inch the block into the limit switch or run in at slow speed. If the limit switch does not operate properly, notify the designated person immediately.

b. If a lift is in progress during a shift change, this testing requirement is considered to have been satisfied for the completion of that lift. However, test the limit switch again before the next lift.

c. Never use the hoist-limit switch that controls the upper limit of travel of the load block as an operating control.

8.5.6 Ordinary Lifts

a. Hoisting and rigging operations for ordinary lifts require a designated leader. The designated leader shall be present at the lift site during the entire lifting operation. If the lift is being made by only one person, that person assumes all responsibilities of the designated leader.

b. Leadership designation may be by written instructions, specific verbal instructions for the particular job, or clearly defined responsibilities within the crew's organizational structure.

c. The designated leader's responsibility shall include the following:

1. Ensure that personnel involved understand how the lift is to be made.

2. Ensure that the weight of the load is determined, that proper equipment and accessories are selected, and that rated capacity is not exceeded.

3. Survey the lift site for hazardous/unsafe conditions.

4. Ensure that equipment is properly set up and positioned.

5. Ensure that a signaler is assigned, if required, and is identified to the operator.

6. Direct the lifting operation to ensure that the job is done safely and efficiently.

7. Stop the job when any potentially unsafe condition is recognized.
8. Direct operations if an accident or injury occurs.

d. The operator or other designated person shall visually examine the hoist in accordance with the requirements for a daily inspection described in Section 8.2, “Inspections.”

e. A qualified person shall examine any deficiencies and determine whether they constitute a hazard. Correct these deficiencies before operating the hoist.

f. Load lines shall be checked after strain is put on them, before the load is lifted clear of the ground. If not plumb, the slings or equipment shall be repositioned so that the lines are plumb before continuing.

8.5.7 Critical Lifts

Exhibit I is intended to be a sample form only and is not mandatory. Any other form that accomplishes the purpose is acceptable.
NOTES:  
1. Load test prior to initial use, at 125% of rated capacity, all new hoists or hoists in which load-sustaining parts have been modified, repaired, or replaced. Test weights shall be accurate to within -5%, +0% of stipulated values. Load test at 100% of rated capacity hoists with overload devices. Test the function of the overload device.

2. Qualified inspector shall verify all steps as listed below.

3. Craftsmen will initial all tests, work, and inspections completed below.

_____ 1. Perform the annual periodic inspection. Check unit for proper operation.

_____ 2. HAND-CHAIN-OPERATED HOISTS ONLY. Check brake mechanism for work glazed, or contaminated disks, worn pawls, cams, or ratchets. Check for broken, corroded, or stretched pawl springs. Repair as needed.

_____ 3. ELECTRIC- AND AIR-POWERED HOISTS. Check:
   a. All functional operating mechanisms for misadjustment interfering with proper operation
   b. Limit switches or devices for proper operation
   c. External evidence of damage or excessive wear of load sprockets, idler sprockets, and drums or sheaves
   d. External evidence of wear on motor or load brake
   e. Electrical apparatus for signs of pitting or any deterioration of visible controller contacts
   f. All anchorage or hoist suspensions.

_____ 4. Set hoist up for load test and inspection. Where applicable, ensure that the load chart is legible.

_____ 5. Perform load test using the required test weights (see Note 1) and appropriate slings. Measure a length of the load chain under tension; measure a length of 15 links. If wire rope is used, measure the diameter.

IF HOIST IS EQUIPPED WITH A TROLLEY:

_____ 1. Mount hoist on a monorail.

_____ 2. Rig test weight to load hook (see step 4 above).

HOIST LOAD TEST AND INSPECTION

At the completion of the load test, inspect the following items.

1. Visually inspect and remeasure the load chain and/or hoist rope after the load test. Check for deformed or broken links, stretch, etc.

2. Inspect load hook and suspension hook for bending or twisting.

### LOAD HOOK:

<table>
<thead>
<tr>
<th>Qualified Inspector Verify</th>

<th>PRESENT</th>
</tr>
</thead>
</table>

### SUSPENSION HOOK:

<table>
<thead>
<tr>
<th>Qualified Inspector Verify</th>
<th>Throat Opening</th>
<th>PREVIOUS</th>
<th>PRESENT</th>
</tr>
</thead>
</table>

Qualified inspector shall perform nondestructive tests on hook by visual examination, liquid penetrant examination, or magnetic particle examination.

Acceptance: No cracks, linear indications, laps, or seams.

Hooks with more than 15% normal (new hook) throat opening shall be replaced. Hooks with more than 10 degree twist from the normal (new hook) plane of the hook shall be replaced. Hooks having more than 10% wear in the bowl section or 5% elongation of the shank shall be replaced. Lubricate hook bearing and latch pin as applicable.

Establish three marks, A, B, and C, with a center punch. For ease in measuring, set distances on an even number of inches.

**BEFORE LOAD TEST**

- Length AB _______ in.
- Length BC _______ in.

**AFTER LOAD TEST**

- Length AB _______ in.
- Length BC _______ in.

Check for:

1. Wear and deformation
2. Cracks
3. Signs of opening between Point A and Point B.

#### Exhibit I

Mobile Crane Load Test and Inspection | 9-29
9.1 GENERAL

This chapter applies to commercial truck-mounted cranes; crawler cranes; locomotive cranes; wheel-mounted cranes, multiple control stations; wheel-mounted cranes, single control station; and any variation that retains the same fundamental characteristics. These cranes have a superstructure capable of rotating 360 degrees mounted on a carrier and have boom raising and lowering capabilities.

9.1.1 Operator Training/Qualification

Operators of mobile cranes shall be trained and qualified as required in Chapter 6, “Personnel Qualification and Training.”

9.1.2 Load Limits

a. Since the load rating for mobile cranes may be based on stability and hydraulic or structural competence, load ratings established by the manufacturers shall not be exceeded in operational application.

b. No crane shall be loaded beyond its rated capacity, except for load test purposes as described in Section 9.3, “Testing.”

c. When loads are to be handled that are limited by hydraulic or structural competence rather than by stability, the appointed person shall ensure that the weight of a load approaching rated capacity has been determined within -10 percent, +0 percent before it is lifted.

9.1.3 Load Rating Chart

a. A durable rating chart with legible letters and figures shall be provided with each crane and attached in a location accessible to the operator while at the controls. See Table 9-1 for a sample load rating chart. The data and information to be provided on these charts shall include, but not be limited to, the following:

1. A full and complete range of manufacturer’s crane load ratings at all stated operating radii, boom angles, work areas, and all stated boom lengths and configurations, jib lengths and angles (or offset), as well as alternate ratings for use and nonuse of optional equipment on the crane, such as outriggers and extra counterweights, that affect ratings.

2. A work area chart for which capacities are listed in the load rating chart (see sample in Figure 9-1).

3. Where ratings are limited by structural, hydraulic, or factors other than stability, the limitations shall be shown and emphasized on the rating charts.

4. In areas where no load is to be handled, the work area figure and load rating chart shall state that information.

5. Recommended reeving for the hoist lines shall be shown.

b. In addition to the data required on the load rating chart, the following information shall be shown either on the rating chart or in the operating manual:

1. Recommended parts of the hoist reeving, and size and type of rope for various crane loads.

2. Recommended boom hoist reeving diagram, where applicable; size, type, and length of rope.

3. Tire pressure, where applicable.

4. Cautionary or warning notes relative to limitations on equipment and operating procedures, including indication of the least stable direction.

5. Position of the gantry and requirements for intermediate boom suspension, where applicable.

6. Instructions for boom erection and conditions under which the boom, or boom and jib combinations, may be raised or lowered.

7. Whether the hoist-holding mechanism is automatically controlled or manually controlled, whether free-fall is available, and whether any combination of those exists.

8. The maximum telescopic travel length of each boom telescopic section.

9. Whether sections are telescoped with power or manually.
Table 9-1. Sample load rating chart.

This table is an example of the type of load rating chart that should be included in each crane.

**NOTES:**

a. Above ratings are maximum recommended working loads. Loads between solid lines are computed at 75% of tipping load across treads; with machine on firm, level ground. Loads outside solid lines are limited by strength of boom.

b. For booms 80 ft and longer, use cambered center section; for booms 100 ft and longer, use deep section inserts.
Figure 9-1. Sample work area chart.
Figure 9-1. (continued).
10. The sequence and procedure for extending and retracting the telescopic boom section.

11. Maximum loads permitted during the actual boom-extending operation and any limiting conditions or cautions.

12. Hydraulic relief valve settings specified by the manufacturer.

9.1.4 Load Hoist Brakes

When power-operated brakes that have no continuous mechanical linkage between the actuating and braking means are used, an automatic means shall be provided to set the brake to prevent the load from falling in event of loss of brake-actuating power.

9.1.5 Power-Controlled Lowering

A power-controlled lowering system shall be provided and shall be capable of handling rated loads and speeds as specified by the manufacturer of the crane.

9.1.6 Booms

a. Booms, boom sections, and jibs shall be clearly identified and shall be used only for the purpose recommended by the manufacturer.

b. Lattice booms shall meet the performance requirements of SAE J987, “Crane Structure, Method of Test” (see Chapter 16, “References”).

9.1.7 Counterweight

a. Cranes shall not be operated without the ballast or counterweight being in place as specified by the crane manufacturer. Under specific conditions, such as during crane assembly, unusual boom configurations, etc. the crane manufacturer’s recommendations for the amount of ballast or counterweight shall be adhered to.

b. Ballast or counterweight as specified by the manufacturer shall not be exceeded.

9.1.8 Rerating

a. Cranes may be modified or rerated providing such modifications are analyzed thoroughly by a qualified engineer or manufacturer of cranes. Such action must be approved by the cognizant safety organization.

b. When rerated, crawler, truck, and wheel-mounted cranes shall be tested in accordance with SAE J765, “Crane Load Stability Test Code.”

c. A rerating test report shall be readily available.

d. No cranes shall be rerated in excess of the manufacturer's original load ratings.

9.1.9 Maintenance History

The maintenance history of the crane shall be retained throughout its service life.

9.1.10 Design Standards

a. Structural, mechanical, and electrical components of the crane design shall meet accepted crane design standards, such as PCSA-4, “Mobile Power Crane and Excavator Standards and Hydraulic Crane Standards.”

b. The safety features and operation shall conform, at a minimum, to the provisions of ASME B30.5, “Mobile and Locomotive Cranes.”
9.2 INSPECTIONS

9.2.1 General

Equipment shall operate with a smooth, regular motion without any hesitation, abnormal vibration, binding, gross shimmy, or irregularity. There shall be no apparent damage, excessive wear, or deformation of any load-bearing part of the equipment. All safety devices, load indicators, boom angle and radius indicators, controls, and other operating parts of the equipment shall be checked during each inspection and shall be in good working order.

9.2.2 Initial Inspection

Prior to initial use, all new or modified cranes shall be inspected as required in Section 9.2.6, “Periodic Inspection,” by a qualified inspector to ensure compliance with the applicable provisions of this chapter. Dated and signed inspection reports shall be kept on file and shall be readily available.

9.2.3 Preoperational Check

a. Operators or other designated personnel shall visually inspect items such as the following each day or prior to use if the crane has not been in regular service (records are not required):

1. All control mechanisms for maladjustment interfering with proper operation.
2. Crane hooks and latches for deformation, cracks, and wear.
3. Hydraulic systems for proper oil level.
4. Lines, tanks, valves, pumps, and other parts of air or hydraulic systems for leakage.
5. Hoist ropes for kinking, crushing, birdcaging, and corrosion.
6. Anti-two-block, two-block warning, and two-block damage prevention systems for proper operation.
7. Booms for damage or deformation of structural components.

b. Operators or other designated personnel shall examine deficiencies and determine whether they constitute a safety hazard.

9.2.4 Monthly Inspection

a. The operator or other designated person shall visually inspect the following items for damage, wear, or other deficiency that might reduce capacity or adversely effect the safety of the crane:

1. Critical items such as brakes and crane hooks.
2. Hoist ropes.

b. Lower the hook block to its lowest position and examine for any condition that could result in an appreciable loss of strength.

c. Hooks for cracks, deformation, damage from chemicals, latch engagement (if provided), and evidence of heat damage.

d. A hoist rope with any of the conditions noted in the replacement criteria in Section 9.2.6 shall be removed from service and replaced.

e. Signed and dated inspection records shall be kept on file and shall be readily available.

f. Before the crane is returned to service, correct deficiencies that could reduce its capacity or adversely effect its safety.

9.2.5 Frequent Inspection

a. Operators or other designated personnel shall visually inspect the crane at daily to monthly intervals (records are not required).

b. These inspections shall, in addition to the requirements of Section 9.2.3, “Preoperational Check,” include the following:

1. All control mechanisms for maladjustment, excessive wear, and contamination by lubricants or other foreign matter that could interfere with proper operation.
2. All safety devices for malfunction.
3. Rope reeving for noncompliance with crane manufacturer's recommendations.
4. Electrical apparatus for malfunctioning, signs of excessive deterioration, and accumulation of dirt or moisture.
5. Tires for recommended inflation pressure.

6. Boom sections for damaged, deformed, or missing structural members or parts.

c. Operators or other designated personnel shall examine deficiencies and determine whether a more detailed inspection is required.

9.2.6 Periodic Inspection

a. Complete inspections of the crane shall be performed by a qualified inspector at 1- to 12-month intervals, depending on the crane's activity, severity of service, and environment.

b. The qualified inspector shall examine deficiencies and determine whether they constitute a hazard.

c. Dated and signed inspection records shall be kept on file and shall be readily available.

d. A sample load test and inspection form is included as Exhibit I, which appears at the end of this chapter. This form is intended to be a sample only and is not intended to be mandatory.

e. These inspections shall, in addition to the requirements of Sections 9.2.4, “Monthly Inspection,” and 9.2.5, “Frequent Inspection,” include the following.

9.2.6.1 Cranes

Inspect for:

a. Deformed, cracked, or corroded members in the crane structure and entire boom.

b. Loose bolts or rivets.

c. Cracked or worn sheaves and drums.

d. Hooks damaged from chemicals, deformation, or cracks, or having more than 15 percent in excess of normal throat opening or more than 10 degree twist from the plane of the unbent hook (dye-penetrant, magnetic-particle, or other suitable crack-detecting inspections should be performed at least once a year; see Chapter 13, “Load Hooks,” for additional hook requirements).

e. Worn, cracked, or distorted parts such as pins, bearings, shafts, gears, rollers, and locking devices.

f. Excessive wear on brake and clutch system parts, linings, pawls, and ratchets.

g. Load, boom angle, and other operating aids over their full ranges for any significant inaccuracies (if calibration is required, it shall be done by a qualified person).

h. Gasoline, diesel, electrical, or other power plants for improper performance or noncompliance with safety requirements.

i. Radiators and oil coolers, for leakage, improper performance, or blockage of air passages.

j. Excessive wear of chain drive sprockets and excessive chain stretch.

k. Steering, braking, and locking devices, for malfunctioning.

l. Excessively worn or damaged tires.

m. Rust on piston rods and control valves when crane has been idle.

9.2.6.2 Hydraulic and Pneumatic Hose, Fittings, and Tubing

Inspect for:

a. Evidence of leakage at the surface of the flexible hose or its junction with the metal couplings.

b. Blistering or abnormal deformation of the outer covering of the hydraulic or pneumatic hose.

c. Leakage at threaded or clamped joints that cannot be eliminated by normal tightening or recommended procedures.

d. Evidence of excessive abrasion or scrubbing on the outer surface of a hose, rigid tube, or fitting (means shall be taken to eliminate the interface of elements in contact or to otherwise protect the components).

9.2.6.3 Hydraulic and Pneumatic Pumps and Motors

Inspect for:

a. Loose bolts or fasteners.

b. Leaks at joints between sections.

c. Shaft seal leaks.
d. Unusual noises or vibration.
e. Loss of operating speed.
f. Excessive heating of the fluid.
g. Loss of pressure.

9.2.6.4 Hydraulic and Pneumatic Valves

Inspect for:
a. Cracks in valve housing.
b. Improper return of spool to neutral position.
c. Leaks at spools or joints.
d. Sticking spools.
e. Failure of relief valves to attain correct pressure setting (relief valve pressures shall be checked as specified by the manufacturer).

9.2.6.5 Hydraulic and Pneumatic Cylinders

Inspect for:
a. Drifting caused by fluid leaking across the piston.
b. Rod seal leakage.
c. Leaks at welded joints.
d. Scored, nicked, or dented cylinder rods.
e. Dented case (barrel).
f. Loose or deformed rod eyes or connecting joints.

9.2.6.6 Hydraulic Filters

Evidence of rubber particles on the filter element may indicate deterioration of the hose, “O” ring, or other rubber components. Metal chips or pieces on the filter may denote failure in pumps, motors, or cylinders. Further checking will be necessary to determine the origin of the problem before corrective action can be taken.

9.2.6.7 Wire Rope

a. A qualified inspector shall inspect wire ropes at least annually. More frequent intervals shall be determined by a qualified person and shall be based on such factors as expected rope life as determined by severity of environment, percentage of capacity lifts, frequency rates of operation, and exposure to shock loads. The qualified inspector shall carefully note any deterioration, such as described below, that results in appreciable loss of original strength and determine whether further use of the rope constitutes an acceptable risk. This inspection shall include examination of the entire rope length without detaching it from the drum.

1. Reduction of rope size below nominal diameter, whether due to loss of core support, internal or external corrosion, or wear of outside wires (see Table 9-2).

<table>
<thead>
<tr>
<th>Rope diameter</th>
<th>Maximum allowable reduction from nominal diameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>Up to 5/16 in. (8 mm)</td>
<td>1/64 in. (0.4 mm)</td>
</tr>
<tr>
<td>Over 5/16 in. to 1/2 in. (13 mm)</td>
<td>1/32 in. (0.8 mm)</td>
</tr>
<tr>
<td>Over 1/2 in. to 3/4 in. (19 mm)</td>
<td>3/64 in. (1.2 mm)</td>
</tr>
<tr>
<td>Over 3/4 in. to 1 1/8 in. (29 mm)</td>
<td>1/16 in. (1.6 mm)</td>
</tr>
<tr>
<td>Over 1 1/8 in. to 1 1/2 in. (38 mm)</td>
<td>3/32 in. (2.4 mm)</td>
</tr>
</tbody>
</table>

b. The qualified inspector shall take care when inspecting running rope where rapid deterioration could occur, such as in the following:

1. Sections in contact with saddles, equalizer sheaves, or other sheaves where rope travel is limited.
2. Sections of the rope at or near terminal ends where corroded or broken wires may protrude.

c. The qualified inspector shall take care when inspecting certain ropes such as the following:

1. Rotation-resistant ropes, because of their higher susceptibility to damage. The internal deterioration of rotation-resistant ropes may not be readily observable.

2. Boom hoist ropes, because of the difficulties of inspection and the important nature of these ropes.

d. No precise rules can be given for determining the exact time to replace wire rope because many factors are involved. Safety in this respect depends largely on the use of good judgment by an appointed person in evaluating remaining strength in a used rope, after allowance for deterioration disclosed by inspection. Safety of rope operation depends on this remaining strength.

e. Conditions such as the following shall be sufficient reason for questioning wire-rope safety and for considering replacement:

1. In running ropes, 6 randomly distributed broken wires in one rope lay, or 3 broken wires in one strand in one rope lay.

2. In standing ropes, more than two broken wires in one lay in sections beyond end connections or more than one broken wire at an end connection.

3. In rotation resistant ropes, two randomly distributed broken wires in six rope diameters or four randomly distributed broken wires in thirty rope diameters.

4. One outer wire broken at the point of contact with the core of the rope that has worked its way out of the rope structure and protrudes or loops out from the rope structure; additional inspection of this part of the rope is required.

5. Wear of one-third the original diameter of outside individual wires.

6. Kinking, crushing, birdcaging, or any other damage resulting in distortion of the rope structure.

7. Evidence of heat damage from any cause.

8. Reduction from nominal diameter greater than the amounts listed in Table 9-2.

f. All rope that has been idle for a month or more due to shutdown or storage of a crane on which it is installed shall be inspected before it is placed in service. This inspection shall be for all types of deterioration and shall be performed by an appointed person whose approval shall be required before further use of the rope. A written and dated report of the rope condition shall be filed.

g. In order to establish data as a basis for judging the proper time for replacement, a continuing inspection record shall be maintained.

h. Replacement rope shall be the same size, grade, and construction as recommended by the crane manufacturer, unless otherwise recommended by a rope or crane manufacturer due to actual working-condition requirements.

i. Never use discarded wire rope for slings.

### 9.2.7 Load Hooks/Load Blocks

Load hooks/load blocks that have been changed out shall be inspected by a qualified inspector before returning the crane to service. Inspection records shall be retained throughout the service life of the hook or load block and shall be readily available.

### 9.2.8 Cranes Not in Regular Use

a. A crane that has been idle for 1 month or more but less than 6 months shall be given an inspection according to the requirements of Section 9.2.5 before being placed in service.

b. A crane that has been idle for more than 6 months shall be given a complete inspection according to the requirements of Section 9.2.6 before being placed in service.

c. Standby cranes shall be inspected at least semiannually, according to the requirements of Section 9.2.6. Cranes exposed to adverse environments should be inspected more frequently.
9.3 TESTING

9.3.1 Operational Tests

The following shall be tested during an initial test:

a. Load lifting and lowering mechanisms.

b. Boom lifting and lowering mechanisms.

c. Boom extension and retraction mechanism.

d. Swinging mechanism.

e. Travel mechanism.

f. Safety devices.

9.3.2 Rated Load Test

a. Prior to initial use, all cranes in which load-sustaining parts have been modified, replaced, or repaired shall be load-tested by a qualified inspector or under the direction of that inspector. A designated or authorized person shall determine if repairs made to a crane are extensive and require a rated load test, or if repairs are routine maintenance and require only operational testing. The replacement of rope is excluded from this requirement. However, a functional test of the crane under a normal operating load should be made prior to putting it back in service.

b. Test weights shall not exceed 110 percent of the rated capacity and shall be accurate to within -5 percent, +0 percent of stipulated values.

NOTE: Load tests shall not be conducted in locations where the lift meets the definition of a critical lift (see Chapter 1, “Terminology and Definitions”).

c. A written report shall be furnished by the inspector showing test procedures and confirming the adequacy of repairs or alterations. Test reports shall be kept on file and shall be readily available to appointed personnel.
9.4 MAINTENANCE

9.4.1 Preventive Maintenance

a. A preventive maintenance program based on the crane manufacturer’s recommendations should be established. Dated records should be made available.

b. Replacement parts shall be at least equal to the original manufacturer’s specifications.

c. All moving parts of the crane for which lubrication is specified shall be regularly lubricated. Lubricating systems should be checked for proper delivery of lubricant. Operators and maintenance personnel shall follow the manufacturer’s recommendations as to the points and frequency of lubrication, maintenance of lubricant levels, and types of lubricant to be used.

9.4.2 Maintenance Procedures

a. Before starting adjustments or repairs on a crane, maintenance personnel shall take the following precautions as applicable:

1. Place the crane where it will cause the least interference with other equipment or operations in the area.

2. Lower the lower load block to the ground or otherwise secure it against dropping.

3. Lower the boom to the ground, if possible, or otherwise secure it against dropping.

4. Place all controls in the OFF position and secure all operating features from inadvertent motion by brakes, pawls, or other means.

5. Ensure starting means are rendered inoperative.

6. Stop the power plant or disconnect it at the power takeoff.

7. Relieve hydraulic oil pressure from all hydraulic circuits before loosening or removing hydraulic components.

b. Warning or out-of-order signs shall be placed on the crane controls. Signs or flags shall be removed only by authorized personnel.

c. After adjustments and repairs have been made, the crane shall not be returned to service until all guards have been reinstalled, trapped air has been removed from the hydraulic system, safety devices are reactivated, and maintenance equipment is removed.

d. For locomotive cranes:

1. Employ blue flag protection on each side of the crane (except dead ends).

2. Place derails not less than 50 ft from the crane on each side (except dead ends).

3. Allow only authorized personnel to remove warning signs, flags, and derails.

9.4.3 Wire-Rope Maintenance

Personnel using wire rope shall ensure proper care by doing the following:

a. Store rope to prevent damage or deterioration.

b. Unreel or uncoil rope as recommended by the rope manufacturer and with care to avoid kinking or inducing a twist.

c. Before cutting a rope, use some method to prevent unlaying the strands. Heat-affected zones of flame cut wire rope shall not be allowed to bear load.

d. During installation, avoid dragging the rope in the dirt or around objects which will scrape, nick, crush, or induce sharp bends in it.

e. Maintain rope in a well-lubricated condition to reduce internal friction and to prevent corrosion. Ensure that lubricant applied as part of a maintenance program is compatible with the original lubricant. Consult the rope manufacturer when in doubt. Lubricant applied shall be of the type that does not hinder visual inspection. Those sections of rope that operate over sheaves or are otherwise hidden during inspection and maintenance procedures require special attention when the rope is lubricated.

f. When an operating rope shows greater wear at its ends than on the remainder, its life can be extended (in cases where a reduced rope length is adequate) by cutting off the worn end, thus shifting the wear to different areas of the rope.
9.5 OPERATION

a. The following shall apply to all personnel involved in mobile crane operation.

b. At the initial stage of the planning process, an appointed person shall classify each lift into one of the DOE-specified lift categories (ordinary, critical, or preengineered production).

9.5.1 Conduct of Operator

a. Do not engage in any practice that will divert your attention while operating the crane.

b. Do not operate the crane if you do not meet the requirements contained in Chapter 6 or if you are experiencing a condition resulting in reduced physical or mental capabilities.

c. Keep the operating area free of water, snow, ice, oil, and debris that could cause your hands or feet to slip from the controls.

d. Keep the operating cab windshields clean and free of anything that obstructs vision. Replace broken windows.

e. Ensure proper functioning of tires, horn, lights, battery, controller, lift system (including load-engaging means, chains, hoist rope, and limit switches), brakes, and steering mechanisms. If at any time a lifting device is found to be in need of repair, is defective, or is in any way unsafe, report it immediately to the designated authority and take the unit out of service until it has been restored to safe-operating condition or a determination has been made by the responsible manager that the deficiency will not adversely affect the safe operation of the unit.

f. When two or more cranes are used to lift one load, one designated person shall be responsible for the operation. That person shall analyze the operation and instruct all personnel involved in the proper positioning, rigging of the load, and the movements to be made. That person shall also determine the necessity to reduce crane ratings, position of load, boom location, ground support, and speed of movement.

g. Determine that no one is working on the crane or is close to it before starting the engine or beginning to operate the crane.

h. Barricade accessible areas within the swing radius of the rear of the rotating superstructure of the crane to prevent anyone from being struck or crushed by the crane.

i. Do not hoist two or more separately rigged loads in one lift, even though the combined load is within the crane's rated capacity.

j. When fueling the crane, stop the engine(s) and ensure that smoking or open flames are not permitted within 25 ft of the fueling area.

k. Ensure that a 10BC or larger fire extinguisher is installed at all operator stations. Fire extinguishers shall be maintained in a serviceable condition.

l. Do not store gasoline, acids, caustics, or cleaning solvents that emit toxic fumes in operating cabs. Store fuel in safety cans in safe locations.

m. Ensure that alternate egress routes are not locked on mobile units with operating enclosures.

n. Position the crane on a solid and level footing. It may be necessary in certain situations to use heavy timber mats to build a good working foundation.

o. When swinging the crane, watch out for centrifugal force. Swing the crane slowly to avoid an outward swing of the load. Attach a tag-line to the load if necessary to control the swing.

p. Watch for boom kickback. Never operate with the boom at a higher angle than shown on the capacity charts.

q. Use extreme caution when operating the crane near workers in elevated areas.

r. Use power lowering when lowering loads. When lowering heavy loads, keep the hoist brake as reserve. Use a safety pawl on the boom-hoist drum when not lowering.

s. Avoid two-blocking, caused when the hook block makes contact with boom-point sheaves. A continuing pull on the hoist lines can break the rope or pull the boom back over the cab on some types of booms. On hydraulically telescoping booms, be sure to play out the hoist line when extending and spool in the hoist line when retracting.
t. Lock carrier air brakes ON when operating, and check the pressure of the air brakes frequently.

u. Watch out for the carrier-cab on truck-mounted units when swinging the boom. Keep boom high enough to swing clear of cab.

v. In the absence of crane manufacturer’s instructions regarding maximum wind speeds for operation, operations undertaken at wind speeds in excess of 25 mph should be evaluated by a qualified person to determine if the size, shape and weight of the load can be safely lifted.

w. When a crane is to be operated at a fixed radius, the boom-hoist pawl or other positive locking device shall be engaged.

x. On truck-mounted cranes, no loads shall be lifted over the front area, except as approved by the crane manufacturer.

y. Crane cabs, necessary clothing and personal belongings shall not interfere with access or operations.

z. Tools, oil cans, waste, extra fuses, and other necessary articles shall be stored in the tool box, and shall not be permitted to lie loose in or about the cab.

9.5.1.1 Traveling the Machine

When traveling the machine:

a. Secure the boom and hook block.

b. Check bridges before crossing; make sure they will support the weight of the machine.

c. Check river depths before fording.

d. Check clearances under overpasses, overhead lines, or any overhead obstruction; when side clearances are tight, install a barrier or post a lookout, and make certain there is sufficient clearance for tail swing.

e. When traveling with a load, snub the load to prevent swaying if possible; never travel with near-capacity loads.

f. Never travel a rubber-tired unit with a load over the side.

g. On soft surfaces, always move with the load behind; it helps to raise the leading end of the crawlers and makes traveling safer.

h. Always set swing brakes when the unit is idle or holding loads for a period of time, especially on slopes; if swinging during travel is necessary, engage swing-jaw clutch before releasing brakes.

i. Never back up until it is determined that everyone is clear of the machine.

j. Position the boom in the direction of travel for long moves.

k. Block treads when moving uphill; be sure they are blocked to prevent downhill movement before shifting steering clutches.

l. Lock the turntable before traveling on a highway. Use a house lock or swing brake, and lower boom into the rack to prevent swing.

m. When loading machine on the trailer, always use a ramp; if a ramp is not available, use blocking to build one.

9.5.1.2 Making Adjustments or Repairs

a. When making adjustments or repairs:

1. Stop the machine.

2. Lower the boom or secure it against dropping.

3. Neutralize all controls.

4. Lock starter and remove ignition key to make the machine inoperative.

5. Display proper warning signs on controls of machine.

6. Keep hands, feet, and clothing away from gears, ropes, drums, and sheaves.

7. Never put hands on wire rope when climbing to the top of the cab.

8. Use a bar or stick to guide wire rope onto drums.

9. Keep hands well away from the fan drive while engine is running.

10. Safeguard the crane oiler; do not resume operation until a positive ALL CLEAR signal has been given.

11. Replace all guards and shields before resuming operation.
b. Place blocking or other adequate supports under the boom before beginning boom disassembly operations. Never stand under or on the boom during this work.

c. Before disconnecting oil lines, if machine has hydraulic controls, be sure to place boom on the ground or in the boom rest; then move the pedals and control levers to equalize pressures within the cylinders. Always release any air supercharge on the hydraulic reservoir and shut off the engine (or declutch pumps) before disconnecting oil lines.

d. Do not reach into hydraulic-boom holes unless the sections are securely anchored together.

9.5.1.3 Ensuring Stability

a. Know the rated capacity of the crane and the weight of the load. A safe lift depends on many factors including boom length, boom angle, and load radius. Follow these requirements to avoid buckling the boom or tipping:

1. Know the radius of the load; the radius is measured from center of rotation, not from the boom foot pin.

2. Always operate within the rated capacity of the machine.

3. The gross capacity includes weight of hook, block, and any material-handling devices, (i.e., slings, concrete bucket, magnet lifter, etc.); subtract the weight of all these to find the true weight (net capacity) the crane can handle safely.

4. Ratings are based on operating the machine on firm, level ground; outriggers should be properly extended and lowered before operation.

5. Avoid fast swings, hoists, or sudden braking; these can cause overloads.

6. Do not handle large, heavy loads in strong winds; the wind can catch the load and create an unstable condition.

b. Test stability before lifting heavy loads. Check outrigger footing. Lift load slightly off the ground and stop. Check the machine for movement and check to be sure the brakes hold with the load elevated.

c. Never use machine stability to determine capacity.

d. If there are any indications of tipping, the machine is already overloaded for that working radius.

e. Do not back crane away from the load while carrying a maximum load; this may cause the crane to tip.

f. Always use outriggers when making lifts (with pick-and-carry units), and never lift a load forward of the front outriggers, unless allowed on manufacturer's load chart.

g. Lower outrigger jacks until the tires clear the ground, and level the unit to reach the machine's full capacity. Recheck and, if necessary, reset outriggers between heavy lifts.

h. Always fully extend outrigger beams unless otherwise specified on the manufacturer's load charts for the crane.

9.5.1.4 Observing Boom-Length Precautions

a. Always use the shortest boom possible.

b. Make only vertical lifts; never pull the load sideways.

c. Keep speed slow in lifting and lowering loads.

d. Swing carefully and slowly, and avoid boom or jib "whipping"; check counterbalance clearance.

e. Do not let the load strike the boom or outriggers.

f. Allow maximum clearance between the hook block and boom-point sheaves.

g. Keep near-capacity loads as close to the ground as possible.

h. Avoid hitting anything with the boom; an engineering analysis shall be made before putting the crane back in service if this occurs.

9.5.2 Operating Near Power Lines and Transmitter Towers

It is recognized that operating mobile cranes where they can become electrified from electric power lines is an extremely hazardous practice. It is advisable to perform the work so there is no possibility of the crane, load line, or load becoming a conductive path, (Figure 9-2).
Figure 9-2. Danger zone for cranes and lifted loads operating near electrical transmission line
The following steps shall be taken to minimize the hazard of electrocution or serious injury as a result of contact between the energized power lines and the crane, load line, or load:

a. The (electric) Power Marketing Administrations in DOE may deviate from the requirements of Table 9-3, providing the work is done according to line management-approved procedures that do not conflict with statutory or approved variances from these regulations.

b. Any overhead wire shall be considered to be an energized line unless and until the person owning the line or the electrical utility authorities indicate that it is not an energized line.

c. Durable signs shall be installed at the operator's station and on the outside of the crane, warning that electrocution or serious bodily injury may occur unless a minimum clearance of 10 ft (3.1 m) is maintained between the crane or the load being handled and energized power lines. Greater clearances are required because of higher voltage as stated in Table 9-3. These signs shall be revised but not removed when a local jurisdiction requires greater clearances.

d. Exercise caution when working near overhead lines having long spans as they tend to move laterally or vertically due to the wind, which could cause them to breach the safety zone.

e. Cranes shall not be used to handle materials stored under electric power lines unless any combination of the boom, load, load line, or machine component cannot enter the prohibited zone.

f. Crane operators shall not rely on the coverings of wires for their protection.

9.5.2.1 Crane Operation Near De-energized and Grounded Electric Power Lines

This is the preferred condition under which the operation can be performed safely. The hazard of injury or death due to electrocution has been remove. The following steps shall be taken to assure de-energization of the power lines has occurred:

a. The power company or owner of the power lines shall de-energize the lines.

b. The lines shall be visibly grounded to avoid electrical feedback and appropriately marked at the job-site location.

c. A qualified representative of the owner of the lines or a designated representative of the electrical utility shall be on site to verify that steps (a) and (b) have been completed and that the lines are not energized.

9.5.2.2 Power Lines Energized, Crane Operating Less than Erected/Fully Extended Boom Length away from the Prohibited Zone (see Figure 9-3)

a. An on-site meeting between project management and a qualified representative of the owner of the lines or a designated representative of the electrical utility shall take place to establish the procedures to safely complete the operations.

b. The specified clearance between the power lines and the crane, load line, and load shall be maintained at all times as specified in Table 9-3.

c. Load control, when required, shall utilize tag lines of a non-conductive type.

d. A designated signaler, whose sole responsibility is to verify that the required clearance is maintained shall be in constant contact with the crane operator.

e. No one shall be permitted to touch the crane or the load unless the designated signaler indicates it is safe to do so.

f. Operation of boom and load over electric power lines is extremely dangerous, due to perception of distance and multiple contact points as viewed from the position of the operator and/or position of the designated signaler. The operator should avoid operating the crane, with or without a load, in this area.

g. The horizontal and vertical distance of movement of long span lines due to the wind shall be added to the minimum clearance distance as specified in Table 9-3. A qualified representative of the owner of the lines or a designated representative of the electrical utility shall be consulted for specific distances.

h. Devices such as ribbons, balls, etc., should be attached by a qualified person to the power lines to improve visibility, or equivalent means employed to aid in location of the prohibited zone.
Table 9-3. Safe working distance from power lines.

a. When operating near high-voltage power lines:

<table>
<thead>
<tr>
<th>Normal voltage (phase to phase)</th>
<th>Minimum required clearance</th>
</tr>
</thead>
<tbody>

</tr>
</tbody>
</table>
Figure 9-3. Danger zone for cranes and lifted loads operating near electrical transmission line.
9.5.2.3 Crane Operations are Within the Prohibited Zone and the Power Lines are Energized

a. Before such operations take place, a qualified person together with a qualified representative of the utility or an engineer qualified in power line transmission shall, after visiting the site, determine if this is the most feasible way to complete the operation, and set minimum required clearances and procedures for safe operations. These operations shall be under their supervision.

The following guidelines should be required:

1. Crane/load grounded to a neutral line by the utility.

2. Electrical system protective devices that automatically re-energize the circuit after a power line contact occurrence should be blocked or disengaged to inhibit this function.

3. Insulated barriers, which are not a part of nor an attachment to the crane and which will not allow contact between the energized electric power lines and the crane, load lines, or load.

4. Non-conductive barricades to restrict access to the crane work area.

b. Load control, when required, shall utilize tag lines of a non-conductive type.

c. A designated signaler, whose sole responsibility is to verify that the clearances established are maintained, shall be in constant contact with the crane operator.

d. The person responsible for the operation shall alert and warn the crane operator and all persons working around or near the crane about hazard of electrocution or serious injury and instruct them on how to avoid the hazard.

e. All non-essential personnel shall be removed from the crane work area.

f. No one shall be permitted to touch the crane or the load unless the signaler indicates it is safe to do so.

9.5.2.4 Crane in Transit With No Load and Boom Lowered (see Figure 9-4)

a. Cranes in transit with no load and boom lowered shall maintain clearance as specified in Table 9-3.

b. A designated signaler shall be assigned to observe the clearance and give warning before the crane approaches the above limits.

c. When planning transit of the crane, the effect of speed and terrain on the boom and crane movement shall be considered.

9.5.2.5 Crane Operation Near Transmitter Towers (see Figure 9-5)

a. Prior to work near transmitter towers where an electrical charge can be induced in the equipment or materials being handled, the transmitter shall be deenergized or tests shall be made to determine if electrical charge is induced on the crane. The following precautions shall be taken when necessary to dissipate induced voltages:

1. The equipment shall be provided with an electrical ground directly to the upper rotating structure supporting the boom.

2. Ground jumper cables shall be attached to materials being handled by boom equipment when electrical charge is induced while working near energized transmitters; crews shall be provided with nonconductive poles having large alligator clips or other similar protection to attach the ground cable to the load.

3. Combustible and flammable materials shall be removed from the immediate area prior to operations.

9.5.3 Hoist-Limit Switch

Check all limit switches, if supplied, without a load on the hook at the beginning of each work shift or the first time the crane is used that shift. Inch each motion into its limit switch to ensure that two-blocking does not occur during the test. If a lift is in progress during a shift change, this testing requirement is considered to have been satisfied for the completion of that lift. However, test the limit switch again before the next lift.
Figure 9-4. Danger zone for cranes and lifted loads operating near electrical transmission line. (See Table 9-3 for minimum radial distance of prohibited zone.)
Figure 9-5. Danger zone for cranes and lifted loads operating near electrical transmission line.
9.5.4 Standard Hand Signals

The standard hand signals for DOE use shall be as specified in the latest edition of the ASME B30 standards for the particular type of crane or hoist being used (see Figure 9-6).

c. Ensure the load is well secured and properly balanced in the sling or lifting device before it is lifted more than a few inches.

d. Take care to make certain that the sling clears all obstacles.

9.5.5 Identification of Signalers

a. All personnel acting as signalers during crane operations shall be clearly identified to the crane operator by the use of the following (one or more, as required by the responsible manager): orange hardhat, orange gloves, and orange vest. This requirement may be waived by the responsible manager when the lift is very closely controlled or personnel are required to wear special clothing for protection from a hazardous environment.

b. In those cases where the crane operator cannot see the signaler, a second person (relay signaler) shall be stationed where he or she can see both the signaler and the crane operator and can relay the signals to the operator. The relay signaler shall also be clearly identified by the items described in the previous paragraph.

c. Where voice (direct or two-way radio) communication is used, the signaler shall communicate directly with the operator, not through a third person.

d. The operator shall obey signals only from the designated signaler. *Obey a STOP signal no matter who gives it.*

9.5.6 Size of Load

The crane shall not be loaded beyond its rated capacity, except for authorized testing described in Section 9.3.

d. Cranes shall not be used for side pulls, except when specifically authorized by a designated person who has determined that the stability of the crane is not endangered and that various parts of the crane will not be over stressed.

e. Avoid carrying loads over people.

9.5.7 Attaching the Load

a. Ensure that the hoist rope is free from kinks or twists. Do not wrap the hoist rope around the load.

e. Load does not contact any obstructions. A “dry run” shall be conducted in areas where clearance is limited.

b. Ensure that the load is attached to the load-block hook by means of slings or other approved devices.

f. No hoisting, lowering, swinging, or traveling shall be done while anyone is on the load or hook, except as noted in Chapter 4, “Lifting Personnel.”
HOIST. With forearm vertical, forefinger pointing up, move hand in small horizontal circles.

LOWER. With arm extended downward, forefinger pointing down, move hand in small horizontal circles.

USE MAIN HOIST. Tap fist on head, then use regular signals.

USE WHIPLINE (Auxiliary Hoist). Tap elbow with one hand, then use regular signals.

RAISE BOOM. Extend arm, fingers closed, thumb pointing upward.

LOWER BOOM. Extend arm, fingers closed, thumb pointing downward.

MOVE SLOWLY. Use one hand to give any motion signal and place other hand motionless above the hand giving the motion signal. (Hoist slowly shown as example.)

RAISE THE BOOM AND LOWER THE LOAD. With arm extended, thumb pointing up, flex fingers in and out as long as load movement is desired.

LOWER THE BOOM AND RAISE THE LOAD. With arm extended, thumb pointing down, flex fingers in and out as long as load movement is desired.

Figure 9-6. Standard hand signals for controlling mobile crane operation.
SWING. Extend arm, point with finger in direction of swing of boom.

STOP. Extend arm, palm down; move arm back and forth horizontally.

EMERGENCY STOP. Both arms extended, palms down, move arms back and forth horizontally.

TRAVEL. Extend arm forward, hand open and slightly raised; make pushing motion in direction of travel.

DOG EVERYTHING. Clasp hands in front of body.

TRAVEL (Both Tracks). Use both fists in front of body, making a circular motion about each other, indicating direction of travel, forward or backward (for land cranes only).

TRAVEL (One Side Track). Lock the track on side indicated by raised fist. Travel opposite track indicated by circular motion of other fist, rotated vertically in front of body (for land cranes only).

EXTEND BOOM (Telescoping Booms). Hold both fists in front of body, thumbs pointing outward.

RETRACT BOOM (Telescoping Booms). Hold both fists in front of body, thumbs pointing toward each other.

Figure 9-6. (continued).
EXTEND BOOM (Telescoping Boom). One-hand signal. Hold one fist in front of chest, thumb tapping chest.

RETRACT BOOM (Telescoping Boom). One-hand signal. Hold one fist in front of chest, thumb pointing outward and heel of fist tapping chest.

Figure 9-6. (continued).
g. Test the brakes each time a load approaching the rated capacity is handled by raising the load a few inches and applying the brakes.

h. Do not lower the load below the point where less than two full wraps of rope remain on the hoist drum.

i. Do not leave your position at the controls while the load is suspended, unless required to do so by an approved emergency procedure.

j. If the load must remain suspended for any considerable length of time, the operator shall hold the drum from rotating in the lowering direction by activating the positive controllable means of the operator’s station.

k. Work on suspended loads is prohibited under normal conditions. When the responsible manager decides that it is necessary to work on a suspended load, guidelines for ensuring safety of the work shall be established through consultation with the appropriate safety organization. Suspended loads that must be worked on shall be secured against unwanted movement.

l. Tag lines should be used as required to guide, snub, or otherwise control the load.

9.5.9 Ordinary Lifts

a. The requirements of all preceding paragraphs in Section 9.5, “Operation,” also shall apply to ordinary lifts.

b. An appointed person shall classify each lift into one of the DOE categories (ordinary, critical or preengineered production) before the lift is planned.

c. Hoisting and rigging operations for ordinary lifts require a designated leader who shall be present at the lift site during the entire lifting operation. If the lift is being made by only one person, that person assumes all responsibilities of the designated leader.

d. Leadership designation may be by written instructions, specific verbal instructions for the particular job, or clearly defined responsibilities within the crew's organizational structure.

e. The designated leader's responsibility shall include the following:

1. Ensure that personnel involved understand how the lift is to be made.

2. Ensure that the weight of the load is determined, that proper equipment and accessories are selected, and that rated capacity is not exceeded.

3. Survey the lift site for hazardous/unsafe conditions.

4. Ensure that equipment is properly set up and positioned.

5. Ensure that a signaler is assigned, if required, and is identified to the operator.

6. Direct the lifting operation to ensure that the lift is completed safely and efficiently.

7. Stop the job when any potentially unsafe condition is recognized.

8. Direct operations if an accident or injury occurs.

f. The designated leader shall inspect all cranes to ensure that they are still within the inspection interval.

g. The designated leader shall inspect all lifting devices to ensure that the rated capacity of these items of equipment will not be exceeded.

h. The operator shall inspect for damage and defects in accordance with Section 9.2.3, including observations during operation. A qualified person shall examine deficiencies and determine whether they constitute a hazard.

i. Check hoist-limit switches, if provided, according to Section 9.5.3, “Hoist-Limit Switch.”

j. Ensure that basic operating instructions of power-operated equipment, together with charts, tables, or diagrams showing the rated capacity, boom angle, swing, and stability data are posted in convenient view of the operator.

k. Check load lines after strain is put on them but before the load is lifted clear of the ground; if load lines are not plumb, reposition the slings or equipment so that the lines are plumb before continuing.

9.5.10 Critical Lifts

Exhibit I is intended to be a sample form only and is not mandatory. Any other form that accomplishes the purpose is acceptable.
MOBILE CRANE LOAD TEST AND INSPECTION

REMARKS (Unusual conditions—noises, structural cracks, misalignment, etc.)

___________________________________________________________________________

SAFETY ITEMS: (Fire extinguisher, signs, guards, etc.)
MOBILE CRANE LOAD TEST AND FOLLOWUP CHECKS

NOTES:  
1. Craftsman shall initial all steps completed below.

2. Qualified inspector shall verify all steps below.

1. Set crane up for load test and inspection.

2. Perform operations test without load to verify proper function of the following:
   - Load lifting and lowering mechanisms
   - Boom lifting and lowering mechanism
   - Boom extension and retraction mechanisms
   - Swinging mechanism
   - Travel mechanism
   - Safety devices.

3. Test loads shall not exceed 110% of rated capacity. Refer to load chart for load test capacity at maximum and minimum working radius. Check boom angle indicators for accuracy.

4. Rig test weights to hook using appropriate slings.

5. Hoist the test load a sufficient distance to ensure that the load is supported by the crane and held by the hoist brakes. Hold the load for 10 min or the time required to check all primary load-bearing parts while under load without slippage, damage, or permanent deformation.

6. At least once during the lifting portion of the hoisting cycle and once during the lowering cycle, power to the hoisting equipment shall be completely turned off. There shall be no slippage of the load or overheating of the brakes.

7. Lower the load to approximately 2 in. off the ground to check for swing-roller operation and outrigger stability. Slowly swing test load between outrigger locations.

8. Move the load back to the original position and slowly lower to ground.

9. At the completion of the load test, inspect the following:
   - Visually inspect rope in accordance with Section 9.2.6.

Hooks with more than 15% normal (new hook) throat opening shall be replaced. Hooks with more than 10 degree twist from the normal (new hook) plane of the hook shall be replaced. Hooks having more than 10% wear in the bowl section or 5% elongation of the shank shall be replaced. Lubricate hook bearing and latch pin, as applicable.

Establish three marks, A, B, and C, with a center punch. For ease in measuring, set distances on an even number of inches.

CHAPTER 10
FORKLIFT TRUCKS

This chapter specifies operation, inspection, testing, and maintenance requirements for forklift trucks powered by internal-combustion engines or electric motors and implements the requirements of ASME B56.1 (“Safety Standard for Powered Industrial Trucks—Low Lift and High Lift Trucks”) and B56.6 ("Rough Terrain Fork Lift Trucks"), and ANSI/UL 558 ("Internal-Combustion-Engine-Powered Industrial Trucks") and 583 ("Electric-Battery-Powered Industrial Trucks").

Exhibit I Operators Pre-Shift Inspection Form (Example Only) ......................... 10-27

Exhibit II Forklift Load Test and Inspection Form (Example Only) .................... 10-29
This chapter specifies operation, inspection, testing, and maintenance requirements for industrial trucks powered by electric motors or internal-combustion engines. See Figures 10-3 for examples of powered industrial trucks. Guidelines may also be taken from this chapter regarding pallet trucks and other small miscellaneous non-powered lift trucks (see Figure 10-4), but training, operating, maintenance, inspection, and testing requirements for non-powered equipment shall be based on the manufacturer’s instructions and recommendations.

### 10.1.1 Operator Training/Qualification

Operators of forklift trucks shall be trained and qualified as described in Chapter 6, “Personnel Qualification and Training.”

### 10.1.2 Rated Capacity

Rated capacity is the maximum weight the truck can transport and stack at a specified load center and for a specified load elevation. Trucks shall not be used or tested above their rated capacities.

### 10.1.3 Nameplate(s) and Marking

Every truck shall have appended to it a durable, corrosion-resistant nameplate(s), legibly inscribed with the following information:

a. Truck model and truck serial number.

b. Weight of truck.

c. Rated capacity.

d. Designation of compliance with the mandatory requirements of ASME B56.1, "Safety Standard for Low and High Lift Trucks," applicable to the manufacturer.

e. Type designation to show conformance with the requirements, such as those prescribed by Underwriters Laboratories, Inc., and Factory Mutual Research Corporation.

f. Batteries for use in electric trucks shall have the battery weight legibly stamped on the battery tray near the lifting means as follows: Service Weight _______ lb(kg).

In addition to the above requirements, additional information is required (and allowed) on nameplates on high-lift trucks, electric trucks, and trucks intended for hazardous locations (see ASME B56.1, Section 7.5, "Nameplates and Markings").

#### 10.1.3.1 Fork Arm Data

For forklift trucks purchased after December 1984, each fork arm shall be clearly stamped with its rated capacity in an area readily visible and not subject to wear. For example, the designation 1500 @ 24 means 1,500-lb (680-kg) capacity at 24-in. (600-mm) load center.

### 10.1.4 Attachments

Attachments almost always affect rated capacity of the truck. When a forklift truck is equipped with an attachment, the rated capacity of the truck/attachment combination shall be established by the truck manufacturer. Capacity, operation, and maintenance instruction plates, tags, or decals shall be changed accordingly.

a. The rated capacity of an attachment/truck combination shall not be exceeded.

b. On every removable attachment (excluding fork extensions), a corrosion-resistant nameplate with the following information is required:

1. Model number

2. Serial number on hydraulically actuated attachments

3. Maximum hydraulic pressure (on hydraulically actuated attachments)

4. Weight

5. Capacity
6. The following instructions (or equivalent): "Capacity of truck and attachment combination may be less than capacity shown on attachment. Consult truck nameplate."

NOTE: The above information should be provided by the attachment manufacturer.

10.1.5 Modifications

Modifications or additions that affect capacity or safe operation shall not be performed without prior written approval from the forklift truck manufacturer. Capacity, operation, and maintenance instruction plates, tags, or decals shall be changed accordingly.

10.1.6 Warning Devices

a. Every truck shall be equipped with an operator-controlled horn, whistle, gong, or other sound-producing device(s).

b. The using organization shall determine if operating conditions require the truck to be equipped with additional sound-producing or visual devices (such as lights or blinkers), and shall be responsible for providing and maintaining such devices. Backup or motion alarms that sound continuously may be warranted in special cases but generally are less effective than operator-controlled devices.

10.1.7 Overhead Guards

An overhead guard is intended to offer protection to the operator from falling objects, but it cannot protect against every possible impact. Therefore, it should not be considered a substitute for good judgment and care in load handling.

a. High lift rider trucks, including order picker trucks, shall be equipped with an overhead guard manufactured in accordance with ASME B56.1, unless the following conditions are met:

b. Rough terrain forklift trucks shall be fitted with an overhead guard manufactured in accordance with ASME B56.6.

10.1.8 Fire Hazard Areas

Powered forklift trucks for operation in fire hazard areas shall be of the type recommended in ANSI/NFPA 505 (“Powered Industrial Trucks, Type Designation and Areas of Use”).

10.1.9 Work Atmosphere

a. The operation of forklift trucks may effects the concentrations of carbon monoxide and oxygen in the work location. Concentrations of these materials in the work location must meet the requirements of 29 CFR 1910.1000, Table Z-1 Limits For Air Contaminants, Occupational Safety and Health Standards for General Industry.

b. Where general lighting is less than 2 lumens per square foot, auxiliary directional lighting shall be provided on the truck.

- Small Miscellaneous Truck
10.2 TYPE DESIGNATIONS AND AREAS OF USE

10.2.1 Type Designation

It is essential to use proper equipment in hazardous (explosive) areas. Trucks approved for use in hazardous areas shall have the manufacturer’s label or some other identifying mark indicating approval for the intended use by a recognized national testing laboratory [e.g., Underwriters Laboratories (UL) or Factory Mutual (FM)].

a. Durable markers indicating the designation of the type of truck for use in hazardous areas shall be applied to each side of the vehicle in a visible but protected area. These markers shall be distinctive in shape, as indicated in Figure 10-1.

b. Hazardous-Area Signs. The entrance to hazardous areas shall be posted with a sign to identify the type of forklift truck permitted, see Figure 10-2, or the truck shall be clearly marked as to the area(s) it is not to enter.

10.2.1.2 Non-Hazardous Areas

The following units are not suitable for use in hazardous areas since they include only minimum safeguards against inherent fire hazards:

a. Type D Forklifts — diesel-powered units having minimum acceptable safeguards against inherent fire hazards

b. Type E Forklifts — electrically powered units having minimum acceptable safeguards against inherent fire and electrical shock hazards

c. Type G Forklifts — gasoline-powered units having minimum acceptable safeguards against inherent fire hazards

d. Type LP Forklifts — liquefied-petroleum-gas-powered units having minimum acceptable safeguards against inherent fire hazards

10.2.1.3 Hazardous Areas

The following units are suitable for use in hazardous areas since they are equipped with additional safeguards (i.e., special exhaust, fuel, or electrical systems) or other modifications against inherent fire hazards:

a. Type DS Forklifts — diesel-powered units that are provided with all the requirements for the type D units and that have additional safeguards to the exhaust, fuel, and electrical systems

b. Type DY Forklifts — diesel-powered units that have all the safeguards of the type DS units except that they do not have any electrical equipment, including ignition; they are equipped with temperature-limitation features

c. Type ES Forklifts — electrically powered units that are provided with all the requirements for the type E units and that have additional safeguards to the electrical system to prevent emission of hazardous sparks and to limit surface temperatures

d. Type EE Forklifts — electrically powered units that are provided with all the requirements for the type E and ES units, and that also have electric motors and all other electrical equipment completely enclosed

e. Type EX Forklifts — electrically powered units that differ from type E, ES, or EE units in that the electrical fittings and equipment are designed, constructed, and assembled so that the units may be used in atmospheres containing specifically named flammable vapors, dusts, and, under certain conditions, fibers; type EX units are specifically tested and classified for use in Class I, Group D, or for Class II, Group G locations as defined in NFPA 70, National Electrical Code

f. Type GS Forklifts — gasoline-powered units that, in addition to all the requirements for the type G units, are provided with additional safeguards to the exhaust, fuel, and electrical systems

g. Type LPS Forklifts — liquefied-petroleum-gas-powered units that, in addition to the requirements for the type LP units, are provided with additional safeguards to the exhaust, fuel, and electrical systems.

10.2.2 Specific Areas of Use

The atmosphere or location where the powered
forklift is to be used shall be classified. Location classifications are described as follows:

a. **Class I** — locations in which flammable gases or vapors are present or may be present in the air in quantities sufficient to produce explosive or ignitable mixtures.

b. **Class II** — locations that are hazardous because of the presence of combustible dust.

c. **Class III** — locations where easily ignitable fibers or filings are present but are not likely to be suspended in quantities sufficient to produce ignitable mixtures.

d. **Unclassified** — locations not possessing atmospheres defined as Class I, II, or III locations.
NOTE: The markers for EE, EX, and DY are 5 in. (12.7 cm) high. The rest are 4 in. (10 cm) square. The signs shall have black borders and lettering on a yellow background.

Figure 10-1. Markers to identify type of industrial truck.
Figure 10-2. Building signs for posting at entrance to hazardous areas.

NOTE: The minimum width of the sign is 11 in. (28 cm); the minimum height is 16 in. (40 cm). The sign shall have the word “caution” in yellow letters on a black background. The body of the sign shall have black letters on a yellow background. A marker identical to the one used on the side of the truck as shown in Figure 10-1, shall be installed on the sign.
10.3 INSPECTIONS

10.3.1 Daily Pre-operational Check

Instructions for pre-operational inspections shall be readily available to the operator. It is recommended that the instructions be attached to the equipment. Standard instructions will be suitable for most forklift trucks; however, operating conditions may require additional instructions. A sample Pre-operative inspection checklist is included as Exhibit 1, which appears at the end of this chapter.

Before operating the truck, check its condition, giving special attention to the following:

a. Condition of the tires
b. Tire inflation, if pneumatic tires
c. Warning and safety devices
d. Lights
e. Battery
f. Controls
g. Lift and tilt systems
h. Forks or other load-engaging means
i. Chains and cables
j. Limit switches
k. Brakes
l. Steering mechanism
m. Fuel system(s)

n. Additional items as specified by the manufacturer or that are unique to the facility at which the truck is operated.

Conditions adversely affecting safety shall be corrected before the forklift truck is placed into service.

10.3.2 Initial Inspection of New and Rented Equipment

Prior to initial use, all new or newly arrived rental equipment, or modified forklifts shall be inspected by a qualified inspector to ensure compliance with the provisions of this chapter. For new equipment, an initial inspection shall verify that requirements of the purchase order (or rental agreement) have been met and that the equipment is suitable for its intended use. This inspection shall be documented and should be retained in the forklift truck's history file. A sample load test and inspection form is included as Exhibit II, which appears at the end of this chapter. This form is intended to be a sample only and is not intended to be mandatory.

10.3.3 Inspection and Maintenance

Inspection and maintenance of powered forklift trucks shall be performed in conformance with the following practices:

a. A scheduled planned inspection, maintenance, and lubrication program shall be followed; consult the manufacturer's recommendations.

b. Only trained and authorized personnel shall be permitted to inspect, maintain, repair, and adjust forklift trucks; these services shall be performed in accordance with manufacturer's specifications.

c. No repairs shall be made while the truck is in a hazardous (explosive/classified) area.

d. Inspect brakes, steering mechanisms, control mechanisms, warning devices, lights, governors, lift-overload devices, guards, and safety devices regularly and maintain them in a safe-operating condition.

e. Carefully inspect all parts of lift and tilt mechanisms and frame members and maintain them in a safe-operating condition.

f. For special trucks or devices designed and approved for operation in hazardous areas, ensure that the original, approved safe-operating features are preserved by maintenance.
g. Check fuel systems for leaks and for the proper condition of the parts. Give special consideration in the case of a fuel system leak. Take action to prevent use of the truck until the leak has been corrected.

h. Inspect and maintain all hydraulic systems. Check tilt cylinders, valves, and other similar parts to ensure that drift or leakage has not developed to the extent that it would create a hazard.

i. Maintain capacity, operation safety, and maintenance-instruction plates, tags, or decals in legible condition.

j. Inspect and maintain batteries, motors, controllers, limit switches, protective devices, electrical conductors, and connections. Pay special attention to the condition of electrical insulation.

k. Those repairs to the fuel and ignition systems of industrial trucks which involve fire hazards shall be conducted only in locations designated for such repairs.

l. Trucks in need of repairs to the electrical system shall have the battery disconnected prior to such repairs.

m. Water mufflers shall be filled daily or as frequently as is necessary to prevent depletion of the supply of water below 75 percent of the filled capacity. Vehicles with mufflers having screens or other parts that may become clogged shall not be operated while such screens or parts are clogged. Any vehicle that emits hazardous sparks or flames from the exhaust system shall immediately be removed from service, and not returned to service until the cause for the emission of such sparks and flames has been eliminated.

n. When temperature of any part of any truck is found to be in excess of its normal operating temperature the vehicle shall be removed from service and not returned to service until the cause for such overheating has been eliminated.

o. Industrial trucks originally approved for the use of gasoline for fuel may be converted to liquefied petroleum gas fuel provided the complete conversion results in a truck which embodies the features specified for LP or LPS designated trucks. Conversion equipment and the recommended method of installation shall be approved by the manufacturer.

p. All parts that require replacement shall be replaced only with parts that are equivalent, in regards to safety, to those used in the original design.

q. Attachments shall be included in a scheduled maintenance/inspection program. Inspection steps shall be tailored for the attachment. Load-bearing components shall be examined for deformation and load-bearing welds shall be visually examined for cracks. Mechanical or hydraulic components shall be inspected and maintained in accordance with the manufacturer’s instructions.

r. Attachments shall be inspected not less than annually and the inspection should be documented.

s. Hooks that are included as part of attachments shall be inspected as specified for hooks on cranes/hoists (see Chapter 13.0, “Load Hooks”).

10.3.4 Forks

10.3.4.1 Fork Load Rating

Forks used in pairs (the normal arrangement) shall have a rated capacity of each fork at least half the manufacturer's truck rated capacity at the center distance shown on the forklift truck nameplate.

10.3.4.2 Fork Inspections

a. Forks in use (single shift operation) shall be inspected at intervals of not more than 12 months or whenever any defect or permanent deformation is detected. Severe use applications require more frequent inspection at an interval set by facility management.

b. Fork inspection shall be carried out by a qualified inspector with the aim of detecting any damage, failure, deformation, or other condition that might impair safe use. A fork that shows any of the following defects shall be withdrawn from service, and shall not be returned to service until it is satisfactorily repaired by the fork manufacturer or an expert of equal competence. Fork inspection shall include:

1. Surface Cracks - A thorough visual examination for cracks and, if considered necessary, non-destructive crack detection, with
special attention to the heel and to the welds that attach the mounting components to the fork blank. Inspection for cracks shall include any mounting mechanisms of the fork blank to the fork carrier. Forks shall not be returned to service if surface cracks are detected.

2. **Fork Tine Inspection** - Examination for straightness of blade and shank, fork angle (upper face of blade to load face of the shank), fork blade and shank wear. Difference in height of fork tips may vary from manufacturer to manufacturer and with tine length. For these reasons, fork tine inspections shall be done in accordance with manufacturers requirements.

3. **Positioning Lock** - Confirm that the Positioning Lock (when provided), is in good repair and in correct working order. If any fault is found, the fork shall be withdrawn from service until satisfactory repairs are made.

4. **Fork Hooks Wear** - When fork hooks are provided, the support face of the top hook and the retaining faces of both hooks shall be checked for wear, crushing, and other local deformations. If clearance between the fork and the fork carrier becomes excessive, the fork shall not be returned to service until repaired in accordance with paragraph 10.3.4.3.

5. **Fork Marking** - When fork marking is not clearly legible, it shall be renewed. Marking shall be renewed per instructions from the original fork supplier.

### 10.3.4.3 Fork Repair

Only the manufacturer of the fork or an expert of equal competence shall decide if a fork may be repaired for continued use, and the repairs shall only be carried out by such authorities. Surface cracks or wear should not be repaired by welding. When resetting repairs are required, the fork shall be subject to heat treatment.

### 10.3.5 Battery Maintenance

a. Facilities shall be provided for flushing and neutralizing spilled electrolyte, for fire protection, for protecting charging apparatus from damage by trucks, and for adequate ventilation for dispersal of fumes from gassing batteries.

b. A conveyor, overhead hoist, or equivalent material handling equipment shall be provided for handling batteries.

c. Reinstalled batteries shall be properly positioned and secured in the truck.

d. A carboy tilter or siphon shall be provided for handling electrolyte.

e. When introducing electrolyte into batteries, acid shall be poured into water; water shall not be poured into acid.

f. Trucks shall be properly positioned and brake applied before attempting to change or charge batteries.

g. Care shall be taken to assure that vent caps are functioning. The battery (or compartment) cover(s) shall be open to dissipate heat.

h. Smoking shall be prohibited in the charging area.

i. Precautions shall be taken to prevent open flames, sparks or electric arcs in battery charging areas.

j. Tools and other metallic objects shall be kept away from the top of uncovered batteries.

### 10.3.6 History File

A history file should be maintained for each forklift truck. The history file should contain information necessary to operate, maintain, test, and evaluate the forklift truck. A typical history file would contain the following types of documentation, as applicable:

a. Manufacturer’s operation and maintenance manuals.

b. Waivers applicable to the forklift truck.

c. Documentation for replacement forks.

d. Documentation from the manufacturer authorizing modifications to the forklift truck.

e. Inspection procedures and inspections records.

f. Records of repair, modification, and overhaul.
g. Fork inspection records, including record of fork repair.

h. Authorization from truck manufacturer to use specifically identified attachments.

**NOTE:** For forklift trucks on rental, ensure that a suitable maintenance and inspection program is established for the duration of the rental period. For rental equipment onsite for 6 months or less, a history file is not recommended.
10.4 TESTING

10.4.1 Forklift Truck Load Test

Forklift truck load tests are not routinely required.

a. Load tests shall not be conducted until verification that inspection and maintenance is up to date.

b. Load tests shall be performed after major repair or modification to components that affect the load-carrying ability of the truck.

c. The manufacturer should be consulted if questions arise as to whether a load test is appropriate.

d. Forklift trucks shall be load tested by or under the direction of a qualified person and in accordance with the manufacturer's recommendations.

e. Test weights shall be accurate within -5 %, +0 % of stipulated values.

f. After a load test is performed, a written report shall be furnished by the qualified person that shows test procedures and confirms the adequacy of repairs or alterations. Test reports shall be retained in the truck's history file.

10.4.2 Fork Load Test

A fork that has undergone repair, other than repair or replacement of positioning locks or marking, shall be subject to a load test as described in ASME B56.1, Section 7.25, "Forks," Item 3, which lists loading and method of test for forks; except for the test load, which shall correspond to 2.5 times the rated capacity marked on the fork.

10.4.3 Attachment Load Test

a. Load capacity of an attachment shall be verified by the manufacturer or by a load test at 100 % capacity that is performed onsite. Load tests are not routinely required since a catalog cut, user’s manual, decals on attachment, or other manufacturer’s data serves as capacity verification.
10.5 OPERATIONS

The following shall apply to all personnel involved in forklift operations. At the initial stage of the planning process, an appointed person shall classify each lift into one of the DOE-specified categories (ordinary, critical, or preengineered production).

10.5.1 Conduct of Operator

The following requirements shall be observed by the operator when operating forklift trucks.

10.5.1.1 General

a. Safe operation is the responsibility of the operator. Report all accidents and "near misses" promptly.

b. The operator shall develop safe working habits and also be aware of hazardous conditions in order to protect himself, other personnel, the truck, and other material.

c. The operator shall be familiar with the operation and function of all controls and instruments before operating the truck.

d. Before operating any truck, the operator shall be familiar with unusual operating conditions which may require additional safety precautions or special operating instructions.

e. Be certain the truck has successfully passed a preuse inspection.

f. Do not start or operate the truck, any of its functions or attachments, from any place other than from the designated operator’s position.

g. Keep hands and feet inside the operator’s designated area or compartment. Do not put any part of the body outside the operator compartment of the truck.

h. Never put any part of the body within the reach mechanism of the truck or other attachments.

i. Avoid reaching through the mast for any purpose.

j. To safeguard pedestrians, understand the truck’s limitations and observe the following precautions:

1. Do not drive a truck up to anyone standing in front of an object.

2. Ensure that personnel stand clear of the rear swing area before conducting turning maneuvers.

3. Exercise particular care at cross aisles, doorways, and other locations where pedestrians may step into the path of travel of the truck.

4. Do not allow anyone to stand or pass under the elevated portion of any truck, whether empty or loaded.

k. Do not permit passengers to ride on powered industrial trucks unless a safe place to ride has been provided by the manufacturer.

l. Ensure that fire aisles, access to stairways, and fire equipments is kept clear.

m. A powered industrial truck is considered unattended when the operator is more than 25 ft. (7.6m) from the truck, which remains in his view, or whenever the operator leaves the truck and it is not in his view.

n. Before leaving the operator’s position the operator shall perform the following:

1. Bring truck to a complete stop.

2. Place directional controls in neutral.

3. Apply the parking brake.

4. Fully lower load-engaging means, unless supporting an elevated platform.

o. In addition, when leaving the truck unattended the operator shall perform the following:

1. Stop the engine or turn off the controls.

2. If the truck must be left on an incline, block the wheels.

3. Fully lower the load-engaging means.
p. Maintain a safe distance from the edge of ramps, platforms, and other similar working surfaces. Do not move railroad cars with a powered industrial truck.

q. Do not use a truck for operating or closing railroad car doors except as follows:
   1. Unless the truck utilizes a device specifically designed for opening and closing railroad car doors and the operator is trained in its use.
   2. The design of the door-opening device shall require the truck to travel parallel to the railroad car, with the force applied in a direction parallel with the door travel.
   3. Care should be exercised when engaging the railroad car door with the door opening device, in order to prevent damage to the doors and/or fork truck by heavy impact forces.
   4. The entire door opening operation shall be in full view of the operator.
   5. The fork truck shall always be positioned to safeguard the dock attendant while removing the door lock pin.
   6. Whenever a railroad car door requires an abnormal force to open, the truck operator shall report the condition to his supervisor.

r. Wheel stops, hand brakes, or other recognized positive protection shall be provided to prevent railroad cars from moving during loading or unloading operations.

s. Consider both the truck and load weight when operating in railcars and semitrailers.

t. Inspect floors on trucks, boxcars, unfamiliar ramps, or platforms before start of operation.

u. Other workers should not be inside the truck when the forklift truck is performing loading or unloading operations. Load arrangements and spacing issues should be determined before the forklift enters the truck.

v. Fixed jacks or supports may be needed to prevent upending or corner dipping when powered industrial trucks are driven on and off semitrailers that are not coupled to the tractor.

w. The brakes of highway trucks shall be set and wheel chocks placed under the rear wheels to prevent the trucks from rolling while they are boarded.

x. Care shall be taken to not contact overhead installations such as lights, wiring, pipes, sprinkler systems, etc. If in doubt, measure.

y. Motorized hand trucks shall not be ridden unless they are of the hand/rider design.

10.5.1.2 Traveling

a. Observe all traffic regulations and under all travel conditions, operate the truck at a speed that will permit it to be brought to a stop in a safe manner. Unless facility-specific procedures state otherwise, the guideline is: within plant buildings - 5 mph; on plant roads - 15 mph. Drive slowly around curves.

b. Yield the right of way to pedestrians and emergency vehicles. Whenever possible, establish eye contact with approaching pedestrians or vehicle drivers before continuing.

c. Do not pass another truck traveling in the same direction at intersections, blind spots, or at other locations where vision is obstructed.

d. Slow down and sound horn at cross aisles and other locations where vision is obstructed.

e. Railroad tracks shall be crossed diagonally whenever possible.

f. Never travel with forks raised to unnecessary heights. Approximately 4 to 6 inches (10 to 15 cm) above floor level is adequate.

g. Do not park closer than 6 ft (1800 mm) to the nearest rail or a railroad track.

h. Face in the direction of travel, except if the load being carried obstructs forward view. In such cases travel with the load trailing.

i. When ascending or descending grades, ramps, and inclines:
   1. In excess of 5 percent grade, drive loaded rider trucks with the load upgrade.
   3. Use low gear or slowest speed control.
4. Operate unloaded trucks with the load-engaging means downgrade.

5. The load and load-engaging means shall be tilted back, if applicable and raised only as far as necessary to clear the road surface.

6. Avoid turning if possible, and normally travel straight up and down.

j. While turning, be cautious of rear end swing and keep clear of the edge of loading docks.

k. Make starts, stops, turns, or direction reversals in a smooth manner so as not to shift load and/or overturn the truck.

l. Do not indulge in stunt driving or horseplay.

m. Slow down for wet and slippery floors.

n. Before driving over a dockboard or bridge plate, be sure that it is properly secured.

o. Drive carefully and slowly across the dockboard or bridge plate, and never exceed its rated capacity.

p. Do not drive trucks onto any elevator unless specifically authorized to do so. In cases operation are authorized:

   1. Do not exceed the capacity of the elevator.

   2. Approach elevators slowly, and then enter squarely after the elevator car is properly leveled.

   3. Once on the elevator, neutralize the controls, shut off the power, and set brakes.

   4. It is advisable that all other personnel leave the elevator before truck is allowed to enter or leave.

q. Unless a towing hitch is supplied by the manufacturer, do not use forklift trucks as tow trucks. When a towing hitch is provided, use tow bars rather than wire rope for towing.

r. At the end of the operator’s shift, return the forklift truck to its assigned parking place, set brakes, fully lower load-engaging means, place controls in neutral position, turn ignition off, and secure the key.

s. If the truck is equipped with a seat belt, use it.

10.5.1.3 Loading

a. Since the load rating for forklifts may be based on stability or hydraulic or structural competence, do not exceed the rated capacity in operational application.

b. The designated person shall ensure that the weight of a load approaching the rated capacity (combination of weight and location of the center of gravity) has been determined within -10 percent, +0 percent before it is lifted.

c. Only stable, safely arranged loads shall be handled. Block and secure them if necessary.

d. Caution shall be exercised when handling off-center loads which cannot be centered.

e. Always spread the forks to suit the load width.

f. Extra caution is required when handling loads exceeding the dimensions used to establish truck capacity. Stability and maneuverability may be adversely affected.

g. The forks shall be placed under the load as far as possible; the mast shall be carefully tilted backward to stabilize the load.

h. Do not transport loads or miscellaneous items within the operator’s compartment or other areas of the truck, unless a secure area has been provided and designated by the user.

i. A load backrest extension shall be used whenever necessary to minimize the possibility of the load or part of it from falling rearward.

j. Do not attach or operate any attachment on a forklift truck that has not been approved for use by forklift truck manufacturer.

k. When attachments are used, extra care shall be taken in securing, manipulating, positioning, and transporting the load.

l. Operate trucks equipped with attachments as partially loaded trucks when not handling a load.

m. Fork length should be at least two thirds of the load length.
DOE-STD-1090-99

n. Use extreme care when tilting load forward or backward, particularly when high tiering.

o. Do not tilt forward with forks elevated except to pick up or deposit a load over a rack or stack.

p. When stacking or tiering, use only enough backward tilt to stabilize the load.

q. Do not rig loads from the tines of a forklift truck, (attaching rigging to the forks to support a suspended load) without written management approval.

r. Never lift with one fork without an engineering analysis and approval.

s. Use guides and signalers as necessary. If in doubt, check the conditions personally before proceeding. Standard hand signals are shown in Figure 10.5 "Hand Signals."

t. Do not block fire extinguishers, fire protection sprinklers, or alarm stations when stacking loads.

10.5.2 Lifting of Personnel

Only operator-up high lift trucks have been designed to lift personnel. If a work platform is used on forklift trucks designed and intended for handling materials, take the following precautions:

a. Use a lift platform manufactured for the purpose of lifting personnel with a forklift truck. The platform shall include:

   1. A 4-in. (10-cm) minimum height toe plate provided on the work platform.

   2. The floor of the platform located not more than 8-in (20-cm) above the upper face of the supporting truck fork blade.

   3. A restraining means such as a guard rail having a height above the platform floor of not less than 36 in. (90-cm) or more than 42 in. (110-cm) around its upper periphery and including a midrail.

   4. An access opening in the guard rail maybe hinged or removable, or chains may be used if proper positioning is easily accomplished and a secured condition is discernible.

b. The combined weight of the platform, load, and personnel shall not exceed one-half of the capacity as indicated on the nameplate of the truck on which the platform is used.

c. Whenever a truck (except for high-lift order-picker trucks) is equipped with vertical hoisting controls elevable with the lifting carriage or forks, take the following additional precautions to protect personnel:

   1. Means shall be provided whereby personnel on the platform can shut off power to the truck.

   2. Means shall be provided to render inoperative all operating controls on the elevating platform, when the controls on the elevating platform have been selected for use; only one location of controls shall be capable of being operated at one time.

   3. Emergency-lowering means available at ground level should be provided; such means shall be protected against misuse.
d. Take the following precautions whenever personnel are elevated with a forklift truck:

1. Ensure the truck has a firm and level footing.

2. Place all travel controls in neutral and set parking brake.

3. Before elevating personnel, mark area with cones or other devices to warn of work by elevated personnel.

4. Lift and lower personnel smoothly, with caution, and only at their request.

5. Avoid overhead obstructions and electric wires.

6. Keep hands and feet clear of controls other than those in use.

7. Move truck and/or platform slowly, only for minor adjustments in horizontal positioning when personnel are on the platform, and only at their request.

8. Ensure the mast is vertical - do not operate on a side slope.

9. The platform is horizontal and never tilted forward or rearward when elevated.

10. Personnel are to remain on the platform floor. The use of railings, planks, ladders, etc., on the platform for the purpose of achieving additional reach or height is prohibited.

11. Ensure personnel and equipment on the platform do not to exceed the available space.

12. Lower platform to floor level for personnel to enter and exit. Do not climb on any part of the truck in attempting to enter or exit.

13. The operator shall remain in the control position of the forklift truck.

14. Be certain that the lifting mechanism is operating smoothly throughout its entire lift height, both empty and loaded, and that lift limiting devices and latches, if provided, are functional.

15. Means shall be provided to protect personnel from moving parts of the forklift truck that present a hazard when the personnel platform is in the normal working position.

16. Overhead protection, as necessary for operating conditions, shall be provided.

17. Do not transport personnel from one location to another while they are on the work platform.

18. When not in the operating position, engage the parking brake and block the wheels.

19. Be certain that required restraining means such as railings, chains, cable, body belts with lanyards, or deceleration devices, etc., are in place and properly used.

10.5.3 Standard Hand Signals

a. Standard hand signals for use at DOE locations shall be as specified in the latest edition of the ANSI standards for the particular forklift being used (see Figure 10-5).

b. The operator shall recognize signals only from the designated signaler. *However Obey a STOP signal no matter who gives it.*

c. For operations not covered by standard hand signals, special signals shall be agreed on in advance by both the operator and the signal person, and should not conflict with the standard signals.

10.5.4 Ordinary Lifts

a. The requirements of all preceding paragraphs in Section 10.5, “Operation,” shall also apply to ordinary lifts.

b. Hoisting and rigging operations for ordinary lifts require a designated leader who shall be present at the lift site during the entire lifting operation. If the lift is being made by only one person, that person assumes all responsibilities of the designated leader.

c. Leadership designation may be by written instructions, specific verbal instructions for the particular job, or clearly defined responsibilities within the crew's organizational structure. The designated leader's responsibility shall include the following:
1. Ensuring that personnel involved understand how the lift is to be performed.

2. Ensuring that the weight of the load is determined, that proper equipment and accessories are selected, and that rated capacity is not exceeded.

3. Surveying the lift site for hazardous/unsafe conditions.

4. Ensuring that equipment is properly set up and positioned.

5. Ensuring that a signaler is assigned, if required, and is identified to the operator.

6. Directing the lifting operation to ensure that the job is performed safely and efficiently.

7. Stopping the job when any potentially unsafe condition is recognized.

8. Directing operations if an accident or injury occurs.

10.5.5 Critical Lifts

10.5.6 Equipment Qualification

To qualify for operation, a forklift truck should have the following:

a. A record of successful inspections and maintenance.

b. A frequent (preuse) inspection instruction available to the operator.

c. A qualified operator.

d. Proper type designation for working in a classified hazardous area, if applicable.
Figure 10-5. Standard Hand Signals for Controlling Forklift Operation.

RAISE THE TINES. With forearm vertical, forefinger pointing up, move hand in small horizontal circle.

LOWER THE TINES. With arm extended, palm down, lower arm vertically.

TILT MAST BACK. With forearm vertical, thumb extended, jerk thumb over shoulder.

TILT MAST FORWARD. With arm extended, thumb down, lower arm vertically.

MOVE TINES IN DIRECTION FINGER POINTS. With arm extended, palm down, point forefinger in direction of movement.

DOG EVERYTHING. Clasp hands in front of body.

STOP. Extend both arms, palms down.

Custodian: ___________________________
Forklifts shall be inspected when assigned to service and at least every 12 months thereafter.

Prior to initial use, all new, modified, or extensively repaired forklifts shall be inspected.

Craftsmen shall initial all tests, work, and inspections completed below.

Qualified inspector shall verify inspections have been complete prior to load test.

CRAFTSMAN
INITIAL

1. Ensure capacity, operation, and maintenance-instruction plates, tags, or decals are legible.

2. Check all hydraulic systems including tilt cylinders, valves, and other similar parts to ensure “drift” has not developed.

3. Check fuel system for leaks and condition of parts. Special consideration shall be given in the case of a leak in the fuel system. Immediate action shall be taken to take the forklift out of service until the leak is corrected.

4. Check all parts of lift and tilt mechanisms and frame members to ensure safe operating conditions, such as, but not limited to, hoist chain for damage and excessive wear.

5. Check for proper tire inflation (where applicable). Check that tires are secured properly and are level with each other.

6. Check batteries, motors, controllers, limit switches, protective devices, electrical conductors and connections, with special attention paid to the condition of electrical insulation.

7. Check brakes, steering mechanisms, warning devices, lights, governors, lift overload devices, guards, and safety devices.

Qualified inspector shall use the criteria for Items 8, 9, and 10 to perform visual examination; or as required by the manufacturer, liquid penetrant examination, or magnetic particle examination.

Acceptance: No cracks, linear indications, laps, or seams.

8. Check for forks being secured properly and level with each other.

9. Performs nondestructive test (NDT) on the right angle joint of the fork once every 12 months.

10. Performs NDT on the load or stress-bearing welds that attach the tines to the forklift once every 12 months.
LOAD TEST

NOTES: 1. Read all steps below prior to load test.

2. Forklifts in which load-sustaining parts have been altered, replaced, or repaired shall be load tested prior to initial use.

3. Load test all forklifts at 100% rated capacity.

QUALIFIED INSPECTOR: Shall verify all steps below.

EQUIPMENT NUMBER _______________ EQUIPMENT OPERATOR _______________

Qualified Inspector Verify (Load Test) _______________ Date _______________

Weight _______________

1. Set forklift on solid, level ground.

2. Perform load test using the required weight (see Note 3).

3. Static Test: Forklift trucks shall demonstrate ability to withstand the appropriate test load for a period of at least 10 min without permanent deformation or apparent damage. Load slippage for this equipment shall not be greater than a maximum of 3 in. vertically and 1 in. horizontally at the cylinder.

4. Check system for leaks while undergoing test.

Exhibit II  Rigging Tackle Annual Inspection (Chain) ............................................................ 11-41

Exhibit III  Rigging Tackle Periodic Inspection (Synthetic-Web Slings) ................................. 11-43
11.1 GENERAL

a. The information in this section provides guidance for safely handling lifted loads. Diagrams are used to illustrate hoisting and rigging principles and good and bad rigging practices. This is not a rigging textbook; the information should be applied only by qualified riggers.

b. Wire rope and slings that have been irreversibly damaged or removed from service shall be made unusable for hoisting and rigging operations before being discarded.

c. Load tables are representative only and are not exact for all materials or all manufacturers.

d. Determine the weight of the load:
   1. From markings on the load.
   2. By weighing, if the load is still on a truck or railroad car.
   3. From drawings or other documentation.
   4. By calculation, using the load dimensions and the weights of common materials in Table 11-1.

e. Determine the center of gravity of the load as accurately as possible:
   1. From drawings or other documentation.
   2. From markings on the load.
   3. By calculation.

f. Determine the best method to attach the load and select the appropriate lifting devices (e.g., wire-rope, steel-chain, metal-mesh, or synthetic-web slings).

g. Bending a wire rope over a fixed object such as a pin or a shackle has an effect on the capacity of the rope: the outside wires and strands of a bend have to stretch farther and therefore take a greater percentage of the load.

h. There is a convenient method for estimating the efficiency of the rope as it passes over the bend. This method uses the ratio (R) of the diameter (D) of the object (sheave, pin, corner) about which the wire rope is being bent to the diameter (d) of the rope. The efficiency of the bend can then be estimated using the formula shown in Figure 11-1. Note that the efficiency decreases quickly as the ratio of the diameters decreases.

i. Aside from efficiency, there are other reasons to avoid sharp bends in wire rope, including physical damage to the rope, reduction of service life, and damage to the object about which the rope is bent.

j. When the ratio of the diameter of the bend to the nominal rope diameter (D/d ratio) is small, the strength efficiency factor is lower than when the D/d ratio is relatively large. Load tables do not take into account such factors as abnormal temperatures, excessive corrosion, and vibration.

k. Determine the appropriate ratings of the device to be used, allowing for:

   1. The number of sling legs—Note that a sling leg completely doubled back on itself constitutes two sling legs.

   2. The angle between the horizontal surface of the load and the sling leg—The smaller the angle, the smaller the lifting capacity of the equipment.

   3. Wear—The reduction in strength of the equipment due to normal wear.

Figure 11-1. Efficiency of wire rope when bent and statically loaded to destruction over sheaves and pins of various diameters.
11.2 WIRE ROPE

11.2.1 Wire-Rope Lays

a. In a right-lay rope, the strands twist to the right around the core like a conventional screw thread; in a left-lay rope, the strands twist to the left.

b. A rope has a lang lay when the strands and the individual wires have the same lay direction. When the strands and the wires have an opposite lay direction, the rope has a regular lay.

c. A standard wire rope, unless otherwise stated, is understood to be right regular lay. With few exceptions, all wire rope is made right lay. Left-lay rope is a special-purpose rope.

d. Figure 11-2 shows ropes with right and left lays combined with regular and lang lays.

e. Lay length is the lengthwise distance measured along a wire rope in which a strand makes one complete revolution about the rope's axis.

11.2.2 Wire-Rope Cores

a. Wire rope consists of multistrand metal wires wrapped around a suitable core material. Wire-rope cores are carefully designed and must be precisely manufactured to close tolerances to ensure a perfect fit in the rope. The most common types of cores include the following (see Figure 11-3):

1. **Fiber Core (FC) or Sisal Core**—Sisalanna is the most common fiber that is used in the manufacture of wire-rope cores. In smaller ropes, cotton and jute are sometimes used for the core.

2. **Independent Wire-Rope Core (IWRC)**—The primary function of the core is to provide adequate support for the strands. As the name implies, an IWRC is a separate small-diameter wire rope that is used as the core for a larger wire rope. When severe crushing or flattening of the rope is encountered, an IWRC is usually specified.
11.2.3 Wire Rope for General Purposes

11.2.3.1 6 × 19 Classification

a. Most applications can use a rope from this classification; it is the most versatile of all ropes made. Figure 11-4 shows four varieties of 6 × 19 wire ropes with FCs and IWRCs. Table 11-2 provides breaking strengths for 6 × 19 wire ropes with FC and IWRC cores.

b. The principal types of ropes in this classification include:

1. 6 × 19F—The most popular and versatile of all wire ropes and the most flexible is the 6 × 19F classification. This rope is considered the perfect compromise between maximum abrasion resistance and maximum flexibility.

2. 6 × 16F—Slightly more abrasion resistant than the 6 × 19F, the 6 × 16F makes an excellent rope for small draglines and similar uses. The resistance to wear is gained by a slight sacrifice in flexibility.

3. 6 × 19 Seale—The 6 × 19 Seale is a rugged wire rope for applications involving heavy wear. Car pullers often use this rope, and it is widely used for slushers and drag scrapers.

4. 6 × 19 Warrington—The alternating large and small outer wires make this rope an all-around performer. The 6 × 19 Warrington is used for general-purpose hoisting, churn drills, and miscellaneous slings.

11.2.3.2 6 × 37 Classification

a. When sheaves and drums are fairly small and abrasive conditions are not severe, the ropes in this classification will show better performance than the coarser 6 × 19 construction. Under conditions of repeated bending, they will outlast a 6 × 19 rope; when abrasion is severe, the small outer wires quickly show the effect. Figure 11-5 shows three varieties of 6 × 37 wire rope with FC and IWRC cores. Table 11-3 provides breaking strengths for 6 × 37 wire ropes with FC and IWRC cores.

b. The principal types of ropes in this classification include:

1. 6 × 37 2-operation—A 6 × 37 2-operation strand has 18 outer wires. This construction is used on industrial equipment, for flexible slings, and in miscellaneous hoisting.

2. 6 × 29F—A 6 × 29F is used for applications requiring a flexible rope slightly more resistant to wear than the 6 × 37 2-operation rope.

3. 6 × 41—A 6 × 41 rope is used widely for ropes over 1-in. diameter in the 6 × 37 classification.

11.2.4 Wire-Rope Inspections

A qualified inspector shall inspect wire ropes at least annually. Inspection requirements vary depending on what type of equipment the wire ropes are used on. Refer to other sections in this standard, based on the equipment being used, for specific inspection requirements.

11.2.5 Wire-Rope Maintenance

Personnel using wire rope shall ensure proper care by doing the following:

a. Store rope to prevent damage or deterioration.

b. Unreel or uncoil rope as recommended by the rope manufacturer or a qualified person and with care to avoid kinking or inducing a twist.

c. Before cutting a rope, use some method to prevent unlaying of the strands. Heat-affected zones of flame cut wire rope shall not be allowed to bear load.

d. During installation, avoid dragging the rope in the dirt or around objects that will scrape, nick, crush, or induce sharp bends.

e. Unless prohibited by other considerations, maintain rope in a well-lubricated condition. The object of rope lubrication is to reduce internal friction and to prevent corrosion. Ensure that lubricant applied as a part of a maintenance program is compatible with the original lubricant and is also a type that does not hinder visual inspection. Those sections of rope in contact with sheaves or otherwise hidden during inspection and maintenance procedures require special attention when lubricating rope.

11.3 SLINGS

11.3.1 General

a. Slings shall have a minimum design factor appropriate to the type of material as specified in the appropriate section. Features that affect the rated capacity of the sling and that shall be considered in calculating the design factor are:

1. Nominal breaking strength of material from which it is constructed.
2. Splicing or end-attachment efficiency.
3. Number of parts in the sling.
4. Type of hitch (e.g., straight pull, choker hitch, or basket hitch).
5. Angle of loading and load center of gravity.
6. Diameter of curvature around which the sling is bent.

b. Published working loads for chain slings are usually based on 25–33 percent of the breaking strength.

c. The center of gravity of an object is a point around which the entire weight may be concentrated. To make a level lift, the crane hook or point of suspension must be directly above this point. While slight variations are usually permissible, if the crane hook is too far to one side of the center of gravity, dangerous tilting will result and should be corrected at once. For this reason, when the center of gravity is closer to one point of the sling attachment than to the other, the slings must be of unequal length. Sling stresses and sling angles will also be unequal (see Figure 11-6).

d. Slings shall be secured or terminated at the crane hook so that the sling does not reeve or slip through the hook. To attach the load, locate the center of gravity, position the crane hook directly above the center of gravity, and then rig the load so that it will lift level and true.

11.3.1.1 Load Angle Factor

a. The following is an example of selecting a sling using the load angle factors shown in Figure 11-7.

1. Load = 1,000 lb.
2. Sling = 2-legged bridle.
3. Angle with horizontal = 45 degrees.
4. Load angle factor from Figure 11-7 = 1.414.

b. Each of the two legs would lift 500 lb if a vertical lift were made. However, there is a 45 sling angle involved. Therefore, the 500-lb load would be multiplied by the load-angle factor in the chart, giving a total of 707 lb (500 lb × 1.414) tension in each sling leg. Each sling leg, therefore, must have a rated capacity of at least 707 lb.

11.3.1.2 Safe Load

a. The rated capacity or working load limit (WLL) of a sling varies depending on the type of hitch. The rated capacity tables in this section show the applications for which the various safe loads apply when the slings are new. All ratings are in pounds (lbs).

b. Figures 11-8 and 11-9 provide information for determining the total rated capacity of 3-leg and 4-leg bridle slings. Select multiple-leg slings so as not to introduce a working load in direct tension in any leg greater than that permitted. Two legs should be considered to carry the load because in normal lifting practice, the load will not be uniformly distributed on all legs. If rigging techniques, verified by a qualified rigger, ensure that the load is evenly distributed then full use of three legs is allowed. Special rigging techniques verified by a member of a qualified engineering organization shall be required to prove that a load is evenly distributed over four or more sling legs.
Figure 11-6. Balancing loads.

Figure 11-7. Relationship of load angle and lifting efficiency.
11.3.1.3 Design Factor

In general, a design factor of 5:1 is maintained throughout this section. However, certain sling fittings, such as hooks (which will straighten without breaking) or links (which will deform beyond usefulness before breaking) cannot be assigned a definite numerical design factor. In such cases, suitable safe loads are listed, based on wide experience and sound engineering practice.

11.3.1.4 Sling Care

Proper care and usage are essential for maximum service and safety. Wire-rope slings shall be protected from sharp bends and cutting edges by means of corner saddles, burlap padding, or wood blocking. Overloading shall be avoided, as shall sudden dynamic loading that can build up a momentary overload sufficient to break the sling.

11.3.1.5 Sling Storage

Personnel using slings shall ensure that they are stored properly as follows:

a. Slings should be stored in racks (preferably vertical) and in designated locations when not in use. Do not store slings in a location where they will be subjected to mechanical damage, corrosive action, moisture, extreme heat, or kinking. Slings may require segregated storage as determined on a case-by-case basis.

b. Before storage and periodically during storage, wipe slings clean to remove as much dirt and abrasive grit as possible and relubricate wire rope and chain slings to extend their useful life. Chains should not be lubricated when in use.

c. Do not store metal-mesh slings in areas where the temperature exceeds 550 degrees F (288 degrees C) or 200 degrees F (93 degrees C) if elastomer covered.

d. Do not store synthetic-web slings where the temperature exceeds 200 degrees F (93 degrees C).

11.3.2 Wire-Rope Slings

a. In general, wire-rope slings are made up of 6 × 19 or 6 × 37 classification wire rope. Rotation-resistant wire rope shall not be used for wire-rope slings. Different kinds of slings have been developed for specific purposes. These are divided into different groups or types as follows:

1. Endless-loop slings (grommet construction) and single-part slings with single-rope legs, double-rope legs, or multiple-part rope legs.

2. Two-leg bridle slings with single-rope legs, equalizing double-rope legs, or multiple-part rope legs.

3. Three-leg bridle slings.

4. Four-leg bridle slings.

5. Special slings and combinations.

b. The total load that can be safely lifted with slings depends on the rating of the slings and the manner in which they are attached to the load. Consult (load) Tables 11-4 through 11-9 and Figure 11-10.

c. Braided slings are made by braiding ordinary wire ropes together, thus making them more flexible than wire-rope slings. The size of a braided sling is determined by the diameter of one wire rope and the number of ropes in the cross section of the sling.

d. The design factor for wire-rope slings shall be a minimum of 5:1 based upon breaking strength.

e. When a wire rope sling is used in a choker hitch, the normal angle formed in the rope body as it passes through the choking eye is 120 degrees or greater [do not confuse the choke angle with the angle of inclination of the load (see Figure 11-10)]. Rated load in load capacity Tables 11-4 through 11-9 are for angles of 120 degrees or greater. For smaller angles, reduce the rated load to the percentages given in Figure 11-10.
When legs are not of equal length, use smallest H/L ratio.

NOTE: Load may be supported on only 2 legs while 3rd leg balances it. Therefore, the required SWL is determined by the following:

\[
\text{Total Rated Capacity} = \text{WLL} \times \frac{H}{L} \times 2
\]

Figure 11-8. Determination of capacity—3-leg bridle sling.

When legs are not of equal length, use smallest H/L ratio.

NOTE: Load may be carried by only 2 legs while other 2 legs balance it. Therefore, the required SWL is determined by the following:

\[
\text{Total Rated Capacity} = \text{WLL} \times \frac{H}{L} \times 2
\]

Figure 11-9. Determination of capacity—4-leg bridle sling.

**Notes:**

1. These values only apply when the D/d ratio is 25 or greater (choker and basket hitches)
   
   D = Diameter of curvature around which the body of the sling is bent
   
   d = Diameter of rope

2. Choker hitch values apply only to choke angles greater than 120 degrees.

**Percent of sling rated capacity in a choker hitch.

11.3.2.1 Inspections

a. Wire-rope sling users shall visually inspect all slings each day they are used or prior to use if the sling has not been in regular service (records are not required). In addition, a periodic inspection (with records) shall be made at least annually by a qualified inspector. More frequent intervals should be established if necessary as determined by a qualified person based on:

1. Frequency of sling use.
2. Severity of service conditions.
4. Experience gained on the service life of slings used in similar circumstances.

b. Users shall carefully note any deterioration that could result in an appreciable loss of original strength and determine whether further use of the sling would constitute a safety hazard.

c. A sample annual inspection form is included as Exhibit I at the end of this section. This form is intended to be a sample only and is not intended to be mandatory.

d. Inspection records shall be readily available.

e. Slings shall be immediately removed from service if any of the following conditions are present:

1. Ten randomly distributed broken wires in one rope lay or five broken wires in one strand in one rope lay.
2. Wear or scraping of one-third the original diameter of the outside individual wire.
3. Kinking, crushing, birdcaging, or any other damage resulting in distortion of the rope structure.
4. Evidence of heat damage.
5. End attachments that are cracked, deformed, or worn.
6. Corrosion of the rope or end attachments.

f. Hooks shall be inspected according to Chapter 12, “Rigging Accessories.”

11.3.2.2 Proof-Testing

a. All swaged socket and poured socket sling assemblies shall be certified as having been proof-tested. All other sling assemblies shall be proof-tested when specified by the purchaser.

b. As a minimum, the proof load shall be equal to the rated capacity but shall not exceed:

1. 125 percent of the vertical rated capacity for single-leg, hand-tucked slings.
2. 200 percent of the vertical rated capacity for mechanical-splice single-leg slings and endless slings.

c. The proof-load for multiple-leg bridle slings shall be applied to the individual legs and shall be either 200 percent for mechanical splice or 125 percent for hand-tucked splice, times the vertical rated capacity of a single-leg sling. Master links to which multiple-leg slings are connected shall be proof-loaded to 200 percent times the force applied by the combined legs.

d. Welded end attachments shall not be used unless proof-tested at 2 times rated capacity prior to initial use.

e. Test loads described above shall be accurate to within -5 percent, +0 percent of stipulated values. A written letter of certification by the manufacturer or a pull test witnessed and certified in writing by a qualified person is acceptable.

11.3.2.3 Operation

The following shall apply to all personnel who use wire-rope slings:

a. Ordinary Lifts

1. Start and stop slowly; sudden starts and stops dramatically increase the stresses in hoist ropes and slings. Lift slowly until the load is suspended to minimize swinging.

2. Loads shall be set on blocks. Do not pull a sling from under a load that is resting on the sling.

3. Ensure that wire-rope slings are protected against weather, chemicals, solvents,
and high temperatures.

4. Permanently remove from service fiber-core rope slings that have been exposed to temperatures in excess of 180 degrees F (82 degrees C).

5. Obtain the manufacturer’s written approval for use of wire rope slings of any grade at temperatures between 400 degrees F (204 degrees C) and -60 degrees F (-51 degrees C).

6. Extremely low temperatures (less than 0 degrees F) may cause brittle fractures. Under these conditions, sudden loading should be avoided and the rope should be carefully observed while the load is being applied.

7. Do not use knotted slings.

8. Do not use single-leg wire-rope slings unless proper precautions are taken to prevent suspended loads from rotating.

9. Secure each leg of a wire-rope sling at the hook to prevent reeving of the sling through the hook.

10. Do not make a complete turn of wire rope around the crane hook.

11. Use protector pads or blocking at sharp corners.

12. Keep hands and fingers out of the area between the sling and the load.

13. Ensure that the weight of the load is within the rated capacity of the sling.

14. Do not use damaged slings.

15. Ensure that all personnel stand clear of the suspended load.

17. In a basket hitch, ensure that the load is balanced to prevent slippage.

18. Avoid handling hot material with wire-rope slings.

19. Use shackles or adjustable choker hooks when making choker hitches.

20. Store slings on racks away from moisture and acids when not in use.

21. Ensure that damaged wire-rope slings are rendered unusable, removed from service, discarded, and replaced with new slings.

22. Before use and before storage, check wire-rope slings for:
   i. Broken or cut wires or strands.
   ii. Rust or corrosion.
   iii. Kinks.
   iv. Broken seizing wire.
   v. Damage to swaged fittings.
   vi. Other signs of damage or abuse.

23. The capacity of wire-rope slings is derated by the manufacturer by applying the efficiency factors such as those given in Figure 11-11.

24. Do not use wire-rope clips to fabricate wire-rope slings except where the application of slings prevents the use of prefabricated slings or where the specific application is designed by a qualified person. Slings made with wire rope clips should not be used as a choker hitch (see Figures 11-12 and 11-13).

25. When wire-rope clips are used, the rating of the sling must be derated to 80 percent of the wire-rope rating to allow for the inefficiency of the clips.

26. Double-saddle clips or fist-grip clips (Figure 11-14) may be used to make up general-purpose slings provided the sling is derated to 95 percent of wire-rope capacity.

27. Follow the requirements of 29 CFR 1926.251, Table H-20 or the manufacturer’s recommendation (whichever offers the greater protection) for the number of clips required, correct spacing, and torque. After the initial load is applied to the rope, retighten the clip nuts to the recommended torque to compensate for any decrease in rope diameter caused by the load. Rope clip nuts should be retightened to the recommended torque periodically to compensate for further decrease in rope diameter during usage.
Figure 11-11. Wire-rope fastenings.

Efficiencies of wire rope fittings or fastenings in percentages of strength of rope:

<table>
<thead>
<tr>

</tbody>
</table>

Note that the base of the clip bears against the live end of the wire rope, while the “U” of the bolt presses against the dead end.

Figure 11-12. Wire-rope clips—right way.

The “U” of the clips should not bear against the live end of the wire rope because of the possibility of the rope being kinked or crushed.

Figure 11-13. Wire-rope clips—wrong way.
23. As a minimum, mark wire-rope slings with the rated capacity and inspection due date. This information may be stenciled or stamped on a metal tag affixed to the sling. (Stenciling or stamping on the swages of a sling eye is not recommended.)

24. Slings made of rope with 6 × 19 and 6 × 37 construction and cable-laid slings shall have a minimum clear length of rope 10 times the rope diameter between splices, sleeves, or end fittings.

25. Braided slings shall have a minimum clear length of rope 40 times the component (individual) rope diameter between the loops or end fittings.

26. Grommets and endless slings shall have a minimum circumferential length of 96 times the body diameter of the grommet or endless sling.

b. Critical Lifts

1. All provisions of paragraph 11.3.2.3.a, “Ordinary Lifts,” also shall apply to critical lifts.

2. Wire-rope sling eyes with thimbles shall be made with a thimble having a ratio of thimble diameter (D) to rope diameter (d) of 3 or more (D/d greater than or equal 3).

3. Do not use wedge sockets or wire-rope clips on slings used for critical lifts.

4. Ensure that working loads of wire-rope slings do not exceed their rated capacities.

5. Do not splice slings together.

6. Use thimble eyes for slings to be joined end-to-end.

7. Locate sling eyes so that:

i. Adequate clearance is maintained between the attached slings and other parts or surfaces of the component or equipment.

ii. There is no interference with the functioning of hoisting, rigging, or handling equipment.

iii. Maximum accessibility to the eye is maintained.

iv. Attached slings can converge over the center of gravity of the lift.

v. Proper stability can be maintained during lifting and positioning of the item at the installation site.

vi. The plane of the slinging eye is coincident with the plane of the sling under loaded conditions within ±5 degrees.

vii. Sling angles are not less than 45 degrees with the horizontal.

8. In addition to marking requirements listed for ordinary lifts, other items may need to be marked as determined on a case-by-case basis, such as the reach, type, weight of the sling assembly, and rated capacity.

11.3.3 Alloy Steel-Chain Slings

a. This section applies to slings made from grade 80 alloy chain manufactured and tested in accordance with National Association of Chain Manufacturers welded steel chain specifications—1990. If chain other than this is used, it shall be used in accordance with the recommendations of the chain manufacturer.

b. Alloy Steel-chain slings differ from wire-rope slings in that components using wire are replaced by link chain. Other sling components are similar. Chain slings are more rugged and flexible, but less shock resistant than wire-rope or braided slings. The size is measured by the link stock.
c. Two basic types with many variations are used: basket type and hook type. An example of each is shown in Figure 11-15.

![Figure 11-15. Types of chain slings.](image)

**Double-basket type**  
**Hook type**

k. The safe-load level of any chain sling is a function of three basic factors: size and number of legs, condition of chain and other components, and sling angle between legs and horizontal. Table 11-10 shows safe loads in pounds per leg which can be carried by various chain-sling arrangements. Note the effect of very low hook height and wide leg spreads.

l. Attachments: Hooks, rings, oblong links, pear shaped links, welded or mechanical coupling links and other attachments shall have a rated capacity at least equal to that of the alloy steel chain with which they are used or the sling shall not be used in excess of the rated capacity of the weakest component.

11.3.3.1 Pre-Use Inspections

Steel-chain sling users shall visually inspect all slings before they are used as follows:

a. Conduct a link-by-link inspection for the following defects: bent links, stretched links, cracks in any section of link, scores, abrasions, heat damage, or markings tending to weaken the links. Reject if discovered.

b. Check rings and hooks for distortion, cracks in weld areas, corrosion, and scores, heat damage, or markings tending to weaken the links. Reject if discovered.

c. Perform inspection on an individual-link basis. If any link does not hinge freely with the adjoining link, remove the assembly from service.

d. Remove from service assemblies with deformed master links or coupling links.

e. Remove from service assemblies if hooks have been opened more than 15 percent of the normal throat opening measured at the narrowest point or twisted more than 10 degrees from the plane of the unbent hook.

f. Do not straighten deformed hooks or other attachments on the job. Assemblies with such defects shall be reconditioned by the manufacturer or discarded.

g. Remove from service assemblies with cracked hooks or other end attachments; assemblies with such defects shall be reconditioned or repaired prior to return to service.

(CFR 1910.184/ANSI/ASME B30.9)

Notes:

(1) Other grades of proof tested steel chain include Proof Coil (Grade 28), Hi-Test (Grade 43) Chain and Transport (Grade 70) Chain. These grades are not recommended for overhead lifting and therefore are not covered in the applicable standards.

(2) Rating of multileg slings adjusted for angle of loading between the inclined leg and the horizontal plane of the load.
11.3.3.2 Annual Inspections

a. A sample annual inspection form is included as Exhibit II at the end of this section. This form is intended to be a sample only and is not intended to be mandatory.

b. Annual inspections shall be conducted by a qualified inspector. In addition to criteria for daily inspections, the qualified inspector shall do the following for annual inspections:

1. Hang chain in a vertical position, if practicable, for preliminary inspection. Chain should hang reasonably straight if links are not distorted.

2. Accurately measure the reach (inside of crane ring to inside of hook) under no load when new and at each inspection, and keep a record of increase in length; an increase in length may be due to stretch (sign of overload or wear).

3. Check for localized stretch and wear. Lift each link from its seat and visually inspect for grooving. If grooving is noticed, verify stock diameter of link to be within the minimum safe dimensions in the table below. Reject chain if it does not meet the requirements in the table.

4. Remove the assembly from service if wear at any point of any chain link exceeds that shown in Table 11-11.

5. Round out sharp transverse nicks by grinding. If the minimum dimensions are reduced below those values specified in Table 11-11, remove the assembly from service.

NOTE: For other sizes, consult chain or sling manufacturer.

6. Check for evidence of heat damage.

11.3.3.3 Proof-Testing

a. Single-leg and endless alloy-steel chain slings shall be certified as having been proof-tested to 200 percent of the rated capacity prior to initial use.

b. The proof load for multiple-leg bridle slings shall be applied to the individual legs and shall be 200 percent of the vertical rated capacity of a single-leg sling. Master links to which multiple-leg slings are connected shall be proof-loaded to 200 percent multiplied by the force applied by the combined legs.

c. Test loads shall be accurate to within -5 percent, +0 percent of stipulated values. Either certification by the manufacturer or a pull test certified by a qualified person is acceptable.

11.3.3.4 Operation

a. The following shall apply to all personnel who use steel-chain slings:

1. Do not set a load on a sling or pull a sling from under a load. Place wooden blocks or other supports under the load to provide sufficient clearance for the chain.

2. Shorten chain slings by hooking back into the chain, into the master link, or with grab hooks. Do not shorten by knotting, twisting, bolting, or inserting the tip of the hook into a link.

3. Do not hammer a chain to force it into position.

4. Protect chain slings from sharp corners that might bend the links. Use a suitable pad to prevent gouging or bending of the chain links, as well as possible scarring of the load.

5. When making choker hitches with chain slings, always face the hook opening out and away from the pull of the sling so that the hooks will not slip out when slack is taken out of the sling.

6. Check steel-chain slings for:

i. Nicks, cracks, gouges, and wear.
ii. Bending, stretching, or shearing of links.

iii. Bends or distortions in hooks.

iv. Rust and corrosion.

v. Uneven lengths when sling legs are hanging free.

vi. Evidence of heat damage.

7. Do not weld or perform local repairs on chain slings. All defective chain slings should be returned, through a formal procedure, to the manufacturer for examination, repair, and recertification.

8. Avoid sudden loading of chain slings.

9. Maintain latches on hooks in good condition.

10. If a chain sling does not look safe, do not use it. Do not assume that a chain sling is safe because it looks new; look for stretched links. If in doubt, check with the supervisor.

11. Do not carry loads on the point or tip of a hook.

12. Avoid unbalanced loads.

13. Do not use homemade links, makeshift fasteners formed from bolts, rods, and the like, or other nonstandard attachments.

14. Do not use makeshift or field-fabricated hooks on steel-chain slings.

15. Hook the ends of all empty chain onto the hoist hook or bull ring.

16. Ensure that steel-chain slings used in DOE-controlled areas are marked, at a minimum, with:

i. Size.

ii. Manufacturer's grade.

iii. Rated load and angle on which the rating is based.

iv. Reach.

v. Number of legs.

vi. Sling manufacturer.

vii. Inspection due date.

17. This information may be stenciled or stamped on a metal tag or tags affixed to the sling.

18. Where slings have more than one leg, ensure that the tag is affixed to the master link.

19. Ensure that the working load does not exceed the rated capacity of the sling.

### 11.3.4 Metal-Mesh Slings

a. Metal-mesh slings (Figure 11-16) shall be classified with the designations shown in Table 11-12, based on types of duty and material classification.

<table>
<thead>
<tr>
<th>Type Designation</th>
<th>Classification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Heavy duty</td>
<td>Carbon steel</td>
</tr>
<tr>
<td></td>
<td>Stainless steel</td>
</tr>
<tr>
<td>Medium duty</td>
<td>Carbon steel</td>
</tr>
<tr>
<td></td>
<td>Stainless steel</td>
</tr>
<tr>
<td>Light duty</td>
<td>Carbon steel</td>
</tr>
<tr>
<td></td>
<td>Stainless steel</td>
</tr>
</tbody>
</table>

b. The carbon steel used in metal-mesh slings shall be processed to produce the required mechanical properties.
c. The material used for stainless-steel metal-mesh slings shall conform, at least, to the American Iron and Steel Institute standards for Type-302 or Type-304 stainless steel. Other materials may be used. When metal-mesh slings are produced from such materials, however, the sling manufacturer should be consulted for specific data.

d. The handle shall be designed to ensure:
   1. At least the same rated capacity as the fabric.
   2. No visible permanent deformation after proof-testing.

e. The fabric and handles shall be so joined that:
   1. The rated capacity of the sling is not reduced.
   2. The load is evenly distributed across the width of the fabric.
   3. Sharp edges do not damage the fabric.

f. Metal-mesh slings may be painted, plated, impregnated with elastomers such as neoprene or polyvinyl chloride (PVC), or otherwise suitably coated. The coating shall not diminish the rated capacity of a sling.

g. The design factor for metal-mesh slings shall be a minimum of 5:1 based upon breaking strength.

h. Metal-mesh slings shall not be used to lift loads greater than the rated capacity, properly derated for other than straight-pull configurations (Table 11-13).

i. Except for elastomer-impregnated slings, all metal-mesh slings covered by this section may be used without derating in a temperature range from -20 degrees F (-29 degrees C) to 550 degrees F (288 degrees C).

j. All metal-mesh slings covered by this section and impregnated with PVC or neoprene shall be used only in a temperature range from 0 degrees F (-18 degrees C) to 200 degrees F (93 degrees C).

k. For operation at temperatures outside these ranges or for other impregnations, consult the manufacturer for specific data.

(CFR 1910.184/ANSI/ASME B30.9)
11.3.4.1 Inspections

a. Users of metal-mesh slings shall visually inspect all metal-mesh slings before each use.

b. Annual inspections shall be made by a qualified inspector, and inspection records shall be kept on file and be readily available.

c. Metal-mesh slings shall be removed from service if any of the following defects are present:
   1. A broken weld or brazed joint along the sling edge.
   2. A broken wire in any part of the mesh.
   3. Reduction in wire diameter of 25 percent due to abrasion or 15 percent due to corrosion.
   4. Lack of flexibility due to distortion of the mesh.
   5. Distortion of the female handle so the depth of the slot is increased by more than 10 percent.
   6. Distortion of either end fitting so the width of the eye opening is decreased by more than 10 percent.
   7. A 15 percent reduction of the original cross-sectional area of metal at any point around a handle eye.
   8. Any distortion or twisting of either end fitting out of its plane.
   9. Cracked end fitting.
   10. Evidence of heat damage.

11.3.4.2 Proof-Testing

a. Metal-mesh slings shall be certified as having been proof-tested to 200 percent of their rated capacity prior to initial use.

b. Coated slings shall be proof-tested prior to being coated.

c. Test loads shall be accurate to within -5 percent, +0 percent of stipulated values. Either certification by the manufacturer or a pull test certified by a qualified person is acceptable.

11.3.4.3 Operation

a. The following shall apply to all personnel who use metal-mesh slings:
   1. Ensure that the weight of the load is within the rated capacity of the sling.
   2. Ensure that metal-mesh slings have suitable characteristics and rated capacity for the load and environment.

b. Metal-mesh slings should be long enough to provide the maximum practical angle between the sling leg and the horizontal (minimum practical angle at the crane hook if vertical angles are used).

c. Do not shorten metal-mesh slings with knots, bolts, or other unapproved methods.

d. Do not use damaged slings.

e. Securely hitch metal-mesh slings to the load.

f. Ensure that sharp corners are padded.

g. Keep hands and fingers out of the area between the sling and the load.

h. Ensure that all personnel stand clear of the suspended load.

i. Avoid shock loading.

j. Do not pull metal-mesh slings from under a load when the load is resting on the sling.

k. Do not store metal-mesh slings in an area where they will be subjected to mechanical damage or corrosive action.

l. Avoid twisting and kinking of the legs.

m. In a choker hitch, ensure that metal-mesh slings are long enough so that the female handle chokes freely on the mesh, never on the handle.

n. In a choker hitch, ensure that the load is balanced. When this cannot be done, consult the manufacturer for a derating factor or for other means of handling this type of load.

o. In a basket hitch, ensure that the load is balanced to prevent slippage.

p. Do not use metal-mesh slings in which the spirals are locked or are without free articulation.
q. Never hammer a sling to straighten a spiral or cross rod or to force a spiral into position.

r. Metal-mesh slings used in pairs should be attached to a spreader beam.

s. Ensure that all metal-mesh slings have a permanently affixed metal identification tag or tags containing the following information:
   1. Manufacturer's name or trademark.
   2. Rated load in vertical, basket, and choker hitches.
   3. Inspection due date.

**11.3.5 Synthetic-Web Slings**

a. Synthetic web shall possess the following qualities:
   1. Be of sufficient strength to meet the sling manufacturer's requirements.
   2. Have uniform thickness and width.
   3. Have selvage edges and not be split from its woven width.

b. The thread used in the manufacture of a synthetic-web sling shall be of the same type of material as the web.

c. Fittings shall be:
   1. Of sufficient strength to sustain twice the rated capacity without permanent deformation.
   2. Of a minimum breaking strength equal to that of the sling.
   3. Free of all sharp edges that would in any way damage the mesh.

d. The stitching in all load-bearing splices shall be of sufficient strength to maintain the sling design factor.

e. Synthetic-web slings may be coated with elastomers or other suitable material that will provide characteristics such as abrasion resistance, sealing of pores, and increased coefficient of friction.

f. The design factor for synthetic-web slings shall be a minimum of 5:1 based upon breaking strength.

g. Rated capacities are affected by the type of hitch used and by the angle from the vertical when used as multilegged slings or in basket hitches. The sling manufacturer shall supply data on these effects.

h. Synthetic-web slings are available in a number of configurations as follows (see Figure 11-17):

1. **Endless or Grommet Sling**—Both ends of one piece of webbing are lapped and sewn to form a continuous piece. They can be used as vertical hitches, bridle hitches, in choker arrangements, or as basket slings. Because load contact points can be shifted with every lift, wear is evenly distributed and sling life is extended.

2. **Standard Eye and Eye**—Webbing is assembled and sewn to form a flat-body sling with an eye at each end and the eye openings in the same plane as the sling body. The eyes may either be full web width or may be tapered by being folded and sewn to a width narrower than the webbing width.

3. **Twisted Eye**—An eye-and-eye type that has twisted terminations at both ends. The eye openings are at 90 degrees to the plane of the sling body. This configuration is also available with either full-width or tapered eyes.

i. In place of the sewn eyes, synthetic-web slings are also available with metal end fittings (see Figure 11-18). The most common are triangle and choker hardware. Combination hardware consists of a triangle for one end of the sling and a triangle/rectangle choker attachment for the other end. With this arrangement, both choker and basket hitches, as well as straight hitches, may be rigged. They help reduce wear in the sling eyes and thus lengthen sling life.
Figure 11-17. Synthetic-web sling types.
j. Despite their inherent toughness, synthetic-web slings can be cut by repeated use around sharp-cornered objects. They eventually show signs of abrasion when they are repeatedly used to hoist rough-surfaced products. There are, however, protective devices offered by most sling manufacturers that minimize these effects (see Figure 11-19). Other protective devices include:

1. Buffer strips of leather, nylon, or other materials that are sewn on the body of a sling protect against wear. Leather pads are the most resistant to wear and cutting, but are subject to weathering and gradual deterioration. They are not recommended in lengths over 6 ft due to the different stretching characteristics of leather and webbing. On the other hand, nylon-web wear pads are more resistant to weathering, oils, grease, and most alkalis; and they stretch in the same ratio as the sling body.

2. Edgeguards consist of strips of webbing or leather sewn around each edge of the sling. This is necessary for certain applications where the sling edges are subject to damage.

3. Sleeve- or sliding-tube-type wear pads are available for slings used to handle material having sharp edges. They can be positioned on the sling where required, do not move when the sling stretches, adjust to the load, and cover both sides of the sling.

4. Reinforcing strips that double or triple the eye's thickness and greatly increase its life and safety can be sewn into the sling eyes.

5. Coatings can be applied to provide added resistance to abrasion and chemical damage. These treatments also increase the coefficient of friction, affording a better grip when loads with slippery surfaces are to be handled. These coatings can be brightly colored for safety or load-rating purposes.

6. Cotton-faced nylon webbing can be used for hoisting rough-surfaced material.

k. The synthetic-web sling capacities listed in Tables 11-14 and 11-15 are approximate only and are based on nylon webbing having breaking strengths between 6,000 and 9,000 lb/in. of webbing width. The capacities are also based on a 5:1 design factor and assume that the end fittings are of adequate strength.

l. Although safe working loads for bridle hitches in the choker or double-basket configuration are provided, they should be used only with extreme caution because, as the sling angle decreases, one edge of the web will take all the load, producing a risk of tearing (see Figure 11-20).

m. Synthetic-web slings, other than those described in this section [i.e., polyester round and kevlar fiber (yarn) slings], shall be used in accordance with the sling manufacturer's recommendation.

n. Conventional three-strand natural or synthetic fiber rope slings are NOT recommended for lifting service and should be used only if conventional sling types are not suitable for a unique application. The requirements of ASME B30.9 ("Slings"), Section 9-4, and 29 CFR 1910.184(h) shall be followed.

CAUTION: Tiedown and/or ratchet strap shall not be used as synthetic-web slings. Only synthetic-web slings constructed from webbing approved for sling construction by the manufacturer or other qualified person shall be used at DOE locations.

11.3.5.1 Inspections

a. Users of synthetic-web sling shall visually inspect all slings before each use.

b. Annual inspection shall be made by a qualified inspector, and inspection records shall be kept on file and readily available.

c. When it is necessary to use a nylon or polyester sling in a radiation area, the responsible manager shall ensure that radiation exposure does not exceed 100,000 rad during the life of the sling.
Figure 11-18. Metal end fittings.

REGULAR. This is the type of edge protection that is sewn on to give fixed protection at expected wear points. They can be sewn anywhere on the sling, at any length on one side, or on both sides.

EDGEGUARD. A strip of webbing or leather is sewn around each edge of the sling. This is necessary for certain applications where the sling edges are subject to damage.

SLEEVE. Sometimes called sleeve or sliding-tube type wear pads, these pads are ideal for handling material with sharp edges because the sleeve does not move when the sling stretches and adjusts to the load. Sleeves cover both sides of the sling and can be shifted to points of expected maximum wear.

Figure 11-19. Web and edge protectors.

(CFR 1910.184/ANSI/ASME B30.9)

1. For an endless sling with vertical hitch carrying a load of such size as to throw the legs more than 5 deg. off vertical use rated load data for eye and eye sling, basket hitch and corresponding leg angles.

2. Follow manufacturer's capacities, they vary from manufacturer to manufacturer.

3. Choker hitch values apply only to choke angles greater than 120 degrees.

Nylon Double Ply Web Slings (9,000 lb/in. material)

1. For an endless sling with vertical hitch carrying a load of such size as to throw the legs more than 5 deg. off vertical use rated load data for eye and eye sling, basket hitch and corresponding leg angles.

2. Follow manufacturer’s capacities, they vary from manufacturer to manufacturer.

3. Choker hitch values apply only to choke angles greater than 120 degrees.

(CFR 1910.184/ANSI/ASME B30.9)
d. Slings shall be removed from service if any of the following defects are visible:
   1. Acid or caustic burns.
   2. Melting or charring of any part of the surface.
   3. Snags, punctures, tears, or cuts.
   4. Broken or worn stitches.
   5. Wear or elongation exceeding the amount recommended by manufacturers.
   6. Distortion of fittings.

A sample periodic inspection form is included as Exhibit III at the end of this section. This form is intended to be a sample only and is not intended to be mandatory.

11.3.5.2 Proof-Testing

a. When specified by the purchaser, web slings of all types shall be certified as having been proof-tested prior to initial use. 1.

   The proof load for single-leg slings and endless slings shall be 200 percent of the vertical rated capacity.

   2. The proof load for multiple-leg bridle slings shall be applied to the individual legs and shall be 200 percent of the vertical rated capacity of a single-leg sling. Master links to which multiple-leg slings are connected shall be proof-loaded to 200 percent times the force applied by the combined legs.

b. Test loads shall be accurate to within -5 percent, +0 percent of stipulated values.

Either certification by the manufacturer or a pull test certified by a qualified person is acceptable.

11.3.5.3 Operation

The following shall apply to all personnel who use synthetic-web slings:

a. Determine the weight of the load.

b. Select a sling having suitable characteristics for the type of load, hitch, and environment.

c. Ensure that slings with end fittings that are used in a choker hitch have sufficient length so that the choking action is on the body of the sling.

d. In slings used in a basket hitch, balance the load to prevent slippage.

e. Do not drag slings across the floor or over any abrasive surface.

f. Do not twist or tie slings into knots.

g. Protect slings from being cut by sharp corners, sharp edges, and highly abrasive surfaces.

h. Do not pull slings from under loads when a load is resting on a sling.

i. Do not use synthetic-web slings to lift loads in excess of the rated capacity, properly derated for other than straight-pull configuration.

j. Store synthetic-web slings to prevent mechanical or chemical damage.

k. Do not use nylon slings where acid conditions exist.

l. Do not use polyester and polypropylene slings where caustic conditions exist.

m. Do not use polyester and nylon slings at temperatures in excess of 180 degrees F (82 degrees C), nor polypropylene slings at greater than 200 degrees F (93 degrees C).

n. Do not use aluminum fittings where acid or caustic fumes, vapors, sprays, mists or liquids are present.

o. Ensure that each sling is permanently marked to show:
DOE-STD-1090-99

1. Name or trademark of manufacturer.
2. Manufacturer's code or stock number.
3. Rated capacity for types of hitches used.
4. Type of synthetic-web material.

NOTE: Slings may be marked with a serial number or other identifying number that can be used to determine capacity in situations where it becomes impossible to mark the sling as described above due to security classification of the loads to be lifted or for other valid reasons approved by the responsible manager.

p. Ensure that synthetic-web slings are marked with the inspection due date. This information may be stenciled or stamped on a metal tag affixed to the sling.
Exhibits I through III are intended to be sample forms only and are not mandatory. Any other form that accomplishes the purpose is acceptable.
INSPECTOR ____________________________  INSPECTION DATE _______________________

NOTES:  1. Qualified inspector shall witness and verify all steps below.
        2. Proof-test to 200% of rated capacity to certify new equipment procured without
           manufacturer’s certification. Test loads shall be accurate to within -5%, +0% of the
           stipulated values.

Wire rope shall be immediately removed from service if any of the following conditions are present:

INSPECTION

       1. Ten randomly distributed broken wires in one rope lay or five broken wires in one
          strand in one rope lay.
       2. Wear or scraping of 1/3 the original diameter of the outside individual wire.
       3. Kinking, crushing, birdcaging, or any other damage resulting in distortion of the
          wire-rope structure.
       4. Heat damage.
       5. Cracked, deformed, or worn end attachments.
       6. Hooks that are cracked or opened more than 15% of normal throat opening measured
          at the narrowest point or twisted more than 10 degrees from the plane of the unbent
          hook.
       7. Corrosion of the rope or end attachments.

Wire Rope and Slings
RIGGING TACKLE ANNUAL INSPECTION
(CHAIN)

NOTES: 1. Qualified inspector shall witness and verify all steps below.

2. Proof-test to 200% of rated capacity to certify new equipment procured without manufacturer’s certification. Test loads shall be accurate to within -5%, + 0% of the stipulated values.

INSPECTION

1. Hang chain in a vertical position, if practical, for preliminary inspection. Chain should hang reasonably straight if links are not distorted.

2. Accurately measure the reach (inside of crane ring to inside of hook) under no load when new and at each inspection, and keep a record of increase in length.

3. Check for localized stretch and wear. Lift each link from its seat and visually inspect for grooving. If grooving is noticed, verify stock diameter of links to be within the minimum safe dimension in the table below.

4. Sharp transverse nicks should be rounded out by grinding.

5. Check for evidence of heat damage.

Chain slings shall be immediately removed from service if any of the following conditions are present:

a. Cracked or deformed master links, coupling links, etc.

b. Hooks that are cracked or opened more than 15% of normal throat opening measured at the narrowest point or twisted more than 10 degrees from the plane of the unbent hook.

c. Wear at any point of any chain link exceeding that shown in the table below.

Exhibit I Rigging, Tackle, Accessories Load Test and Inspection (Hooks, Shackles, Rings, etc.) ............................................. 12-23
12.1 GENERAL

a. The information presented in this chapter provides guidance for safely handling lifted loads. Diagrams are used to illustrate hoisting and rigging principles and good and bad rigging practices. This is not a rigging textbook; the information should be applied only by qualified riggers.

b. Rigging accessories that have been damaged or removed from service shall be made unusable for hoisting and rigging operations before being discarded.

c. Load tables are representative only and are not exact for all materials or all manufacturers.

d. Determine the weight of the load:
   1. From markings on the load.
   2. By weighing, if the load is still on the truck or railroad car.
   3. From drawings or other documentation.
   4. By calculation, using the load dimensions and the weights of common materials in Table 12-1.

e. Determine the center of gravity of the load as accurately as possible:
   1. From drawings or other documentation.
   2. From markings on the load.
   3. By calculation.

f. Determine the best method to attach the load and select the lifting devices (e.g., eyebolts or shackles).

12.1.1 Inspections

a. The operator or other designated person shall visually inspect rigging accessories at the beginning of each work shift or prior to use for the following (records not required):

   1. Wear.
   2. Corrosion.
   3. Cracks.
   4. Nicks and gouges.
   5. Distortion such as bending or twisting.
   6. Evidence of heat damage from any cause.

b. A designated person shall determine whether conditions found during the inspection constitute a hazard and whether a more detailed inspection is required.

c. Rigging accessories having any of the following conditions shall be removed from service:

   1. Cracks.
   2. Distortion or deformation exceeding 15 percent of new conditions.
   3. Any sign of incipient failure in shear for shackle pins.
   4. Wear exceeding 10 percent of original dimensions.
   5. Excessive corrosion.
   6. Shackles not marked according to Section 12.3, “Shackles.”
   7. Heat damage.

d. A designated person shall perform nondestructive examinations according to applicable ASTM standards when needed by the responsible line manager or that person’s authorized representative.

e. A sample load test and inspection form is included as Exhibit I at the end of this chapter. This form is a sample only and is not intended to be mandatory.

12.1.2 Testing

a. Tackle assemblies, handling fixtures, and rigging accessories for critical-lift service shall have an initial proof-load test of 2 times the rated capacity. If proof-testing cannot be verified, the tackle shall be proof-tested before being used to make a critical lift.

b. Tackle assemblies, handling fixtures, and rigging accessories shall be tested as a unit when practical. When necessary, parts of such assemblies may be tested individually with the approval of the inspector.

c. Test loads shall be accurate to within -5 percent, +0 percent of stipulated values.

d. All parts showing damage or permanent deformation as a result of load-testing shall be replaced. Replacement parts shall be load-tested in accordance with this paragraph. Discarded parts shall be destroyed.

e. Multileg lift assemblies shall be load-tested based on any two legs sharing the entire load. Attach legs not undergoing test in a manner to ensure that load stability is not lost during the test.

f. Dynamometers and load cells shall be tested and calibrated at least once a year and when specified in the critical lift procedure before being used to make a critical lift. This also applies if they have not been used in the previous 6 months. All calibrated devices shall have a tag affixed indicating date of calibration, by whom they were calibrated, and the date that the next calibration is due.

12.1.3 Good and Bad Rigging Practices

Figure 12-1 illustrates some good and bad rigging practices.

</tr>
</tbody>
</table>

Figure 12-1. Good and bad rigging practices.
Figure 12-1. (continued).
12.2 RIGGING HOOKS

12.2.1 Design

a. Hook design shall meet generally accepted hook design standards and be compatible with the requirements of ASME B30.10, Chapter 10-2, “Hook—Miscellaneous” (see Chapter 13, “Load Hooks,” for equipment load hook requirements.)

b. Latch-equipped hooks shall be used unless the application makes the use of the latch impractical or unnecessary.

12.2.2 Marking

The manufacturer’s identification shall be forged, cast, or die-stamped on a low-stress and nonwearing area of the hook.

12.2.3 Construction

a. The hook material shall have sufficient ductility to permanently deform before failure at the temperature at which the hook will be used.

b. Rated capacities for hooks shall equal or exceed the rated capacity of the chain, wire rope, or other suspension members to which they are attached.

12.2.4 Load Limits

A hook shall not be loaded beyond its rated capacity, except as is necessary to conform to the requirements for load testing of the sling or hardware to which it is attached. See Table 12-2 for hook capacity.

12.2.5 Inspections

12.2.5.1 Initial Inspection

a. A qualified inspector shall inspect all new and repaired hooks prior to initial use to ensure compliance with the applicable provisions of ASME B30.10 Section 10-2.2. Dated and signed inspection records shall be kept on file and shall be readily available.

b. Inspection procedure and record keeping requirements for hooks in regular service shall be determined by the kind of equipment in which they are used. When such requirements for hooks are stated in standards for the specific equipment, they shall take precedence over the requirements of this section.

12.2.5.2 Daily Inspection

a. The operator or other designated person shall visually inspect hooks daily or prior to first use, if the hook is not in regular service, for the following (records are not required):

1. Cracks, nicks, gouges.

2. Deformation.

3. Damage from chemicals.

4. Damage, engagement, or malfunction of latch (if provided).

5. Evidence of heat damage.

b. A designated person shall examine deficiencies and determine whether they constitute a safety hazard and whether a more detailed inspection is required.

12.2.5.3 Frequent Inspection

a. The operator or other designated personnel shall visually inspect the hook at the following intervals (records are not required):

1. Normal service—monthly.

2. Heavy service—weekly to monthly.

3. Severe service—daily to weekly.

b. Hook service is defined as follows:

1. Normal service—operation at less than 85 percent of rated capacity except for isolated instances.
Table 12-2. Strength of standard sling hooks.

</tbody>
</table>

Notes:

a. The above values are for “Vulcan” and similarly designed standard hooks.

b. The capacity can be found by the diameter of the hole in the eye of the hook. If the throat opening of any hook exceeds the dimension given above the corresponding diameter of the eye, the hook has been over strained and must not be used.
Chapter 12
Rigging Accessories

2. Heavy service—operation at 85 to 100 percent of rated capacity as a regular specified procedure.

3. Severe service—operation at heavy service coupled with abnormal operating conditions.

c. These inspections shall, in addition to the requirements of Section 12.2.5.2, “Daily Inspections,” include the following:

1. Wear.
2. Hook attachment and securing means.

d. A designated person shall examine deficiencies and determine whether a more detailed inspection is required.

12.2.5.4 Periodic Inspection

a. A qualified inspector shall perform a complete inspection at the following intervals:

1. Normal service—yearly.
2. Heavy service—semiannually.

b. A qualified inspector shall examine deficiencies and determine whether they constitute a safety hazard.

c. The inspection shall include the requirements of Section 12.2.5.3, “Frequent Inspection.”

d. Hooks shall receive a nondestructive examination according to applicable ASTM standards annually.

e. Hooks having any of the following conditions shall be removed from service until repaired or replaced:

1. Deformation—Any bending or twisting exceeding 10 degrees (or as recommended by the manufacturer) from the plane of the unbent hook.
2. Throat opening—Any distortion causing an increase in throat opening exceeding 15 percent (or as recommended by the manufacturer).
3. Wear—Any wear exceeding 10 percent (or as recommended by the manufacturer) of the original section dimension of the hook or its load pin.
4. Cracks.

f. If a latch is provided and it becomes inoperative because of wear or deformation or fails to fully bridge the throat opening, the hook shall be removed from service until the device has been repaired or replaced and the throat opening has been determined not to exceed 15 percent (or as recommended by the manufacturer).

g. Dated and signed inspection records shall be kept on file and shall be readily available.

12.2.6 Testing

a. Hooks not attached to slings or other lifting hardware shall be proof tested to 200 percent of the rated capacity prior to initial use. The test load shall be accurate to within -5 percent, +0 percent of stipulated values.

b. No performance testing of hooks shall be required, except as is necessary to conform to the requirements for the slings or rigging hardware of which they are a part.

12.2.7 Maintenance

a. A designated person shall repair cracks, nicks, and gouges by grinding longitudinally, following the contour of the hook, provided that no dimension is reduced more than 10 percent of its original value (or as recommended by the manufacturer).

b. All other repairs shall be performed by the manufacturer.

12.2.8 Operation

The following shall apply to rigging hook users:

a. Determine that the load or force required does not exceed the rated capacity of the hook’s assembly, especially when considering special conditions such as choking or grabbing.

b. Avoid shock loading.

c. Keep hands, fingers, and body from getting between the hook and the load.
12.3 SHACKLES

a. Shackles are made of drop-forged steel bent into shape. They are strong, closed attachments that will not come unhooked. The size is specified by the diameter of the body. Avoid side pulls on the shackle body.

b. Shackle pins should fit free without binding. Do not substitute a bolt for the shackle pin. Figure 12-2 shows shackles and provides examples of good and bad practices and inspection points.

c. Each shackle body shall be permanently and legibly marked by the manufacturer. Raised or stamped letters on the side of the bow shall be used to show:

1. Manufacturer's name or trademark.
2. Size.
3. Rated capacity.

d. Shackles that are not properly marked shall be permanently removed from service.

e. When shackles are used at load angles other than 90 degrees, the safe-load rating shall be reduced accordingly.
Figure 12-2. Shackles.
12.4 EYEBOLTS

a. This section specifies requirements for eyebolts that are used as rigging hardware during normal hoisting and rigging activities. eyebolts designed for and permanently installed on existing engineered equipment are considered part of the engineered equipment, and they may not meet all requirements specified for rigging hardware. Eyebolts permanently installed on engineered equipment are acceptable for their intended use so long as they pass normal visual inspection before use. It is important to know how the manufacturer or engineered equipment intends permanently installed eyebolts to be used. In some cases the intended use is obvious to an experienced craftsman in other cases engineering review of vendor information may be necessary.

CAUTION: eyebolts installed by the manufacturer to lift only parts of the engineered equipment are not suitable for lifting the completed piece of equipment. When questions arise regarding the use of manufactured-installed eyebolts, the equipment custodian or cognizant engineer shall be consulted.

b. eyebolts used for hoisting shall be fabricated from forged carbon or alloy steel.

c. Eyeballed marking:

1. Carbon Steel Eyebolts shall have the manufacturer’s name or identification marked forged in raised characters on the surface of the eyeballed.

2. Alloy Steel Eyebolts shall have the symbol “A” (denoting alloy steel) and the manufacturer’s name or identification mark forged in raised characters on the surface of the eyebolt.

d. eyebolts shall have a minimum design factor of 5:1.

e. eyebolts shall have Class II fit and have a minimum of one-and-one-half diameters thread engagement. Nuts on through-eyebolts shall be self-locking or shall be secured with lock wires or other suitable means to prevent loosening.

f. The following shall apply to eyebolt users:

1. Use shouldered eyebolts for all applications, except where it is not possible due to the configuration of the item to be lifted. See Figure 12-3. When unshouldered eyebolts are used, do not use nuts, washers, and drilled plates to make shouldered eyebolts.

2. Do not use wire-type or welded eyebolts in DOE-lifting operations.

3. Ensure shoulders seat snugly against the surface on which they bear.

4. Spacers may be used, if necessary, to ensure proper seating of the eyebolt. Use a flat spacer no thicker than 1/16 of the outside diameter and approximately the same diameter as the maximum axis of the eyebolt shoulder with the smallest inside diameter that will fit the eyebolt shank.

5. Spot-face or slightly counterbore the surface of the item to which the eyebolt is fastened to the minimum depth needed for cleanup of the surface and complete bearing of the shoulder or spacer on the bearing surface.

6. Carefully inspect each eyebolt before use. Visually inspect the hole to ensure that there has been no deformation. Check the condition of the threads in the hole to ensure that the eyebolt will secure and the shoulder can be brought down snug. Destroy eyebolts that are cracked, bent, or have damaged threads.

7. Ensure that the shank of the eyebolt is not undercut and is smoothly radiused into the plane of the shoulder or the contour of the ring for nonshouldered eyebolts.

8. When more than one eyebolt is used in conjunction with multiple-leg rigging, spreader bars, lifting yokes, or lifting beams should be used to eliminate angular lifting. However, where spreaders, yokes, or beams cannot be used, eyebolts may be used for angular lifting, provided that the limiting conditions in Table 12-3 are considered. An angular lift is any lift in which the lifting force is applied at any angle to the centerline of the shank of the eyebolt.

9. Where nonshouldered eyebolts must be used for a critical lift, ensure that an engineering analysis of the loading and load vectors is made and approved before use. Minimize the angle between the sling and the eyebolt axis. In no case shall the eyebolt loading exceed the values shown in Table 12-3.
Figure 12-3. Eyebolts.

Note: The safe working loads for plain (shoulder less) eyebolts is the same as for shoulder bolts under vertical load. Angular loading is not recommended.
12.5 TURNBUCKLES

a. Turnbuckles may be used in sling systems provided that they are engineered, designed, and approved as a part of the sling system. Approved turnbuckles shall be marked and identified for use with the sling set for which they were designed and shall be load-tested as part of the sling set. Before each use, turnbuckles shall be inspected for damage. Damaged threads, jamb nuts, or bent frame members make the unit unsuitable for use.

b. Jamb nuts or locking devices must be tightened or locked before making lifts with turnbuckles. See Figure 12-4 for safe working load information and turnbuckle inspection areas.

c. Turnbuckles shall be fabricated from forged alloy steel and shall have a minimum design factor of 5:1.

d. Turnbuckles used in applications where there is vibration shall be secured to the frame with locks, pins, or wires to prevent turning or loosening.
Figure 12-4. Turnbuckles.
12.6 LINKS AND RINGS

Links and rings are usually designed and manufactured as a part of the lifting hardware for a specific purpose, such as the peak link on multiple-leg slings. However, the rings and links may also be found on the load-attachment end of slings. Figure 12-5 shows typical rings and links. Table 12-4 provides safe loads for weldless rings and links.

</tbody>
</table>
12.7 METAL-PLATE CLAMPS

a. Metal-plate clamps are designed specifically for lifting metal plates. They may also be used for lifting fiber sheets. Their grip or hold is determined by the weight or pull of the load.

b. The following applies to users of metal-plate clamps:

c. The plate shall be inserted all the way into the clamp to obtain a good grip. Ensure proper orientation of the clamp. See Figure 12-6.

d. Plate clamps are suitable for handling only one plate at a time.

e. Avoid side pulls on plate clamps.

f. Check plate clamps for wear in the jaws and for loose, worn, or broken parts.

g. Ensure that the rated capacity of each plate clamp is stamped on its body.

Figure 12-6. Metal-plate clamps.
12.8 LOAD-INDICATING DEVICES

a. Load-indicating devices are not required in routine operations where loads of known and essentially consistent weight are to be handled. Rather, load-indicating devices are required for use with loads of uncertain weight that could be within 90–100 percent of the rated capacity of the equipment or maximum working load of any part of the tackle. Use load-indicating devices where the equipment/tackle configuration could result in binding or friction of the load that could cause a greater stress in the hoist or tackle than would result from the apparent hook load.

b. The accuracy of load-indicating devices shall depend on the requirements of the load system planned and shall not restrict the system requirements; an accuracy of 2 percent of full-scale reading within 10–70 percent of instrument range is recommended. The device should be selected so that the estimated hook load lies between 10 and 70 percent of the instrument range.

c. Dynamometers commonly have design factors of less than 5:1. Any combination where the safety factor of the dynamometer times the capacity of the dynamometer divided by the load equals 5 is acceptable.

d. When dynamometers are used as load-bearing parts of rigging, they must be constructed to provide a measure of safety and reliability equal to that of the associated rigging, or a safety device must be installed to prevent dropping the load in the event of a failure.
12.9 PRECISION LOAD POSITIONERS

a. A precision load positioning device in the load path shall have a design factor of no less than 5:1, based on ultimate strength of the device’s load bearing components.

b. A precision load positioner shall be operated, maintained, calibrated and tested in accordance with the manufacturer’s instructions.

c. Prior to initial use, all new, repaired, and altered precision load positioning devices shall be load tested, and a written report shall be furnished, confirming the load rating. If the load test is not performed by the manufacturer, it shall be done under the direction of a designated or authorized person in strict compliance with the manufacturer’s instructions. Special attention should be paid to the manufacturer’s instructions concerning testing of devices equipped with load gages as they may be damaged during the load test.
Exhibit I is intended to be a sample form only and is not mandatory. Any other form that accomplishes the purpose is acceptable.
RIGGING, TACKLE, ACCESSORIES LOAD TEST AND INSPECTION
(HOOKS, SHACKLES, RINGS, ETC.)

INSPECTOR ___________________________  INSPECTION DATE ______________________________

NOTES:

1. Proof test to 200% of rated capacity for critical lift service to certify new equipment procured
   without manufacturer's certification. Test loads shall be accurate to within -5%, +0% of the
   stipulated values.

2. Qualified inspector shall witness all steps below.

3. Accept/reject data should be to manufacturer's specifications. Hooks, shackles, rings, and the
   like, shall be removed from service and discarded if any of the following conditions are present
   that would cause doubt of the integrity of the accessories:
   
   A. Corrosion, damage, or undue wear
   B. Cracks, twists, or significant change in openings
      (1) 15% more than normal opening
      (2) 10% twist more than normal from the plane of the unbent hook
      (3) 10% wear
      (4) 5% elongation of the hook shank.
   C. Heat damage.

4. Shackles, rings, etc.
   
   A. Wear, corrosion, spreading, and deformation
      (1) 15% deformation of their new condition
      (2) Shackle pins—any sign of incipient failure in shear.

Type _____________  Size ____________  Rated Capacity (SWL) _________________________

CHAPTER 13
LOAD HOOKS

This chapter provides safety standards for the inspection, testing, and maintenance of load hooks installed on cranes or hoists and implements the requirements of ASME B30.10, Chapter 10-1, “Hooks.” See Chapter 12, “Rigging Accessories,” for rigging hook requirements.

13.1 GENERAL .............................................................................................................. 13-1

13.5 MAINTENANCE ................................................................................................. 13-8

13.6 OPERATION ....................................................................................................... 13-9
13.1 GENERAL

13.1.1 Marking

The manufacturer's identification shall be forged, cast, or die-stamped on a low-stress and nonwearing area of the hook.

13.1.2 Attachments

a. Hoisting hooks shall be fitted with a latch to bridge the throat opening to prevent the accidental release of slings or attachments. Hooks without latches may be used in special applications where the latch would interfere with the proper use of the hook, providing that (1) the use of the hook is restricted to the application for which it is approved, and (2) in questionable cases, concurrence is obtained from the appropriate safety organization.

b. If a handle or latch support whose design requires heat-treating is welded to the hook, welding shall be done prior to final heat-treating.

13.1.3 Load Limits

Hooks shall not be loaded beyond rated capacity except during load tests of the equipment of which they are a part.

13.1.4 Hook Standards

a. Hook design shall meet generally accepted hook design standards and be compatible with the requirements of ASME B30.10.

b. The hook material shall have sufficient ductility to permanently deform before failure at the ambient temperatures at which the hook will be used.

c. When a latch is provided, it shall be designed to retain such items as slings under slack conditions. The latch is not intended to support the load.

d. The bearing surfaces of new hooks shall be the arc of a circle. Gauge points, or hook gauges, for measuring spread after load testing should be provided.

e. Field-fabricated hooks shall meet the requirements of this section and shall be approved by the cognizant engineering and safety organizations.
13.2 INSPECTIONS

13.2.1 Hook Service

Hook service is defined as follows:

a. Normal service—operation at less than 85 percent of rated capacity except for isolated instances.

b. Heavy service—operation at 85 to 100 percent of rated capacity as a regular specified procedure.

c. Severe service—operation at heavy service coupled with abnormal operating conditions, (i.e., extreme temperatures, corrosive atmospheres, etc.)

13.2.2 Initial Inspection

a. Prior to initial use, all new and repaired hooks shall be inspected by a qualified inspector to ensure their compliance with the applicable provisions of ASME B30.10 Section 10-1.2. Dated and signed inspection records shall be kept on file and shall be readily available.

b. Inspection procedure and record keeping requirements for hooks in regular service shall be governed by requirements for the kind of equipment in which they are used. When such requirements are stated in standards for the specific equipment, they shall take precedence over the requirements of this section.

13.2.3 Daily Inspection

a. Operators or other designated personnel shall visually inspect hooks for deficiencies such as the following each day or prior to use if the hook has not been in regular service (records are not required):

   1. Cracks, nicks, and gouges.
   2. Deformation.
   3. Damage from chemicals.
   4.Latch engagement, damage to or malfunction of latch (if provided).
   5. Evidence of heat damage.

   b. A designated person shall examine deficiencies and determine whether they constitute a safety hazard and whether a more detailed inspection is required.

13.2.4 Frequent Inspection

a. Operators or other designated personnel shall visually inspect the hook at the following intervals (records are not required):

   1. Normal service—monthly. Operation at less than 85 percent of rated capacity except for isolated instances.

   2. Heavy service—weekly to monthly. Operation at 85 to 100 percent of rated capacity as a regular specified procedure.

   3. Severe service—daily to weekly. Operation at heavy service coupled with abnormal operating conditions, (i.e., extreme temperatures, corrosive atmospheres, etc.)

b. These inspections shall, in addition to the requirements of Section 13.2.3, “Daily Inspection,” include the following:

   1. Wear.
   2. Hook attachment and securing means.

   c. A designated person shall examine deficiencies and determine whether they constitute a safety hazard.

13.2.5 Periodic Inspection

a. A qualified inspector shall perform a complete inspection at the following intervals:

   1. Normal service—yearly.
   2. Heavy service—semiannually.

b. A designated person shall examine deficiencies and determine whether they constitute a safety hazard.

c. The inspection shall include the
requirements of Section 13.2.4, “Frequent Inspection.”

d. Hooks shall receive a nondestructive test (NDT) according to Section 13.4, “Nondestructive Testing.”

e. Hooks having any of the following conditions shall be removed from service until repaired or replaced:

1. **Deformation**—Any bending or twisting exceeding 10° (or as recommended by the manufacturer) from the plane of the unbent hook.

2. **Throat opening**—Any distortion causing an increase in throat opening exceeding 15 percent (or as recommended by the manufacturer).

3. **Wear**—Any wear exceeding 10 percent (or as recommended by the manufacturer) of the original section dimension of the hook or its load pin.

4. **Cracks.**

5. If a latch is provided and it becomes inoperative because of wear or deformation or fails to fully bridge the throat opening, the hook shall be removed from service until the device has been repaired or replaced and the throat opening has been assessed as described above.

f. If hooks are painted, a visual inspection should take the coating into consideration. Surface variations can disclose evidence of heavy or severe service. The surface condition may call for stripping the paint in such instances.

g. Dated and signed inspection records shall be kept on file and shall be readily available.

h. A sample load test and inspection form is included as Exhibit I in Chapter 12, “Rigging Accessories.” This form is intended to be a sample only and is not intended to be mandatory.
13.3 TESTING

a. Each hook of 150-ton capacity or greater and a prototype of each hook design of less than 150-ton capacity shall be proof-tested by the manufacturer in accordance with Table 13-1.

b. When proof tests are used, the hooks shall withstand the proof load application without permanent deformation when the load is applied for a minimum of 15 sec. This condition is considered satisfied if the permanent increase in the throat opening does not exceed 0.5 percent or 0.01 in. (0.25 mm), whichever is greater.

c. For a duplex (sister) hook having a pin eye, the proof load for the eye shall be in accordance with Table 13-1. The proof load shall be shared equally between the two prongs of a sister hook, unless the hook is designed for unbalanced loading.

d. Hooks that have been proof-tested shall be inspected by the magnetic-particle method in accordance with ASTM E-709 (“Standard Practice for Magnetic Particle Examination”) and shall show no cracks, inclusions, or other relevant discrepancies; castings shall be evaluated in accordance with ASTM E-165 (“Standard Practice for Liquid Penetrant Inspection Method.”)

e. No performance testing of hooks shall be required, except as is necessary to conform to the requirements for the equipment of which they are a part.
Table 13-1. Proof test load.

Note: 1 ton (short, 2,000 lb) = 907.2 kg

For hooks with load ratings not shown above, use the next lower load rating for determining the percent of rated load to be applied.
13.4 NONDESTRUCTIVE TESTING (NDT)

13.4.1 NDT Requirements

a. For crane and hoist hooks of 10-ton rated capacity or greater that are assigned to heavy or severe service, a qualified inspector shall perform an NDT at the following intervals:

1. Heavy service: annually.
2. Severe service: semiannually.

b. A designated person or a qualified inspector shall perform an NDT for other hooks when deemed necessary for site-specific reasons.

c. If visual examination reveals a surface intersecting discontinuity (i.e., stress or fatigue cracks), a twist, increased throat opening, or any other defect, an NDT shall be performed to evaluate the hook further, regardless of its rated capacity or service classification.

13.4.2 NDT Records

Dated and signed NDT records, traceable to the hook by a serial number or other identifier, shall be kept on file as long as the hook remains in service and shall be readily available to appointed personnel.

13.4.3 NDT Methods

a. Use magnetic-particle testing or liquid-penetrant testing methods to inspect for surface intersecting discontinuities.

b. A qualified inspector or designated person shall perform NDTs in accordance with the following ASTM standards:

1. ASTM E-709.
2. ASTM E-165.

c. For magnetic-particle testing, a coil, yoke, or wet technique should be used to eliminate the possibility of prod burns or arc strikes.

d. Perform an NDT with the hook in place unless conditions indicate that disassembly for thread or shank inspection is necessary.

13.4.4 Acceptance Criteria

A designated person shall document and resolve the following relevant indications:

a. Arc strikes (welding or electrical).

b. Surface intersecting discontinuities 0.25 in. long or longer.

13.4.5 Discontinuity Removal

a. Two directions of discontinuity, “P” and “T,” are shown on Figures 13-1 and 13-2. Discontinuity “P” parallels the contour of the hook, is considered nonserious, and does not require removal. Discontinuity “T,” on the other hand, is transverse to the contour of the hook and is more serious; when occurring in zones B, C, or D, discontinuity “T” may reduce the longevity of the hook.

b. Discontinuities may be removed by grinding longitudinally following the contour of the hook to produce a smooth, gently undulating surface. In zones B and D, such grinding shall not reduce the original hook dimension by more than 10 percent. Such a reduction will not affect the working load limit rating or the ultimate load rating of the hook. In zone C, grinding shall not reduce the original dimension by more than 5 percent.

c. Under normal and proper application, zone A is an unstressed zone. Therefore, it is not required that discontinuities in that zone be ground out.

d. The hook shall be reexamined by performing an NDT after grinding to verify removal of relevant discontinuities.
Figure 13-1. Shank hook.

Figure 13-2. Eye hook.
13.5 MAINTENANCE

a. A hook latch that is inoperative or missing shall be replaced.

b. A hook with a latch that does not bridge the throat opening shall be removed from service until the latch is replaced or repaired and the hook is examined for deformation with special attention to the throat opening.

c. A designated person shall repair cracks, nicks, and gouges by grinding longitudinally, following the contour of the hook, provided no dimension is reduced more than 10 percent (or as recommended by the manufacturer) of its original value.

d. All other repairs shall be performed by the manufacturer or a qualified person.
13.6 OPERATION

Hook users shall do the following:

a. Determine that the weight of the load to be lifted does not exceed the load rating of the hook.

b. Avoid shock loading.

c. Center the load in the base (bowl or saddle) of the hook to prevent point loading of the hook.

d. Do not use hooks in such a manner as to place a side- or backload on the hook.

e. When using a device to bridge the throat opening of the hook, ensure that no portion of the load is carried by the bridging device.

f. Keep hands and fingers from between the hook and the load.

g. Load duplex (sister) hooks equally on both sides, unless the hook is specifically designed for single loading.

h. Do not load the pinhole in duplex (sister) hooks beyond the rated load of the hook.
CHAPTER 14
BELOW-THE-HOOK LIFTING DEVICES

This chapter provides the requirements for below-the-hook lifting devices used in hoisting and rigging, such as spreader bars, lifting yokes, and lift fixtures. This section implements the requirements of ASME B30.20, “Below-the-Hook Lifting Devices.”

NOTE: Special lifting devices for shipping containers weighing 10,000 lb or more that are used for radioactive materials may be governed by ANSI N14.6 [“Standard for Special Lifting Devices for Shipping Containers Weighing 10,000 Pounds (4,500 kg) or More for Nuclear Materials.”]

Exhibit I Lifting Bars and Spreaders Load Test and Inspection ....................... 14-22
14.1 GENERAL

a. Below-the-hook lifting devices are arranged in the following groups because of the diversity of types:

1. Structural and mechanical lifting devices.
2. Vacuum lifting devices.

b. Slings and rigging accessories that may be components in a below-the-hook lifting device are covered in Chapters 11 and 12 (“Wire Rope and Slings” and “Rigging Accessories,” respectively) of this manual.
14.2 STRUCTURAL AND MECHANICAL LIFTING DEVICES

a. Structural and mechanical lifting devices are often one-of-a-kind designs. Typical devices include:

1. Load-supporting lifting devices (Figure 14-1).
2. Friction-type pressure gripping lifting devices (Figure 14-2).
3. Indentation-type gripping lifting devices (Figure 14-3).
4. Cask lift fixtures (Figure 14-4).

14.2.1 Design/Fabrication

Structural and mechanical lifting devices shall be designed and fabricated according to the provisions of ASME B30.20, 20-1.2.2.

14.2.2 Marking

a. The rated capacity of each lifting device shall be marked on the main structure where it is visible and legible. If the lifting device comprises several items, each detachable from the assembly, each lifting device shall be marked with its rated capacity. At a minimum, a nameplate, name tag, or other permanent marker shall be affixed displaying the following data:

1. Manufacturer's name (contractor's name if fabricated onsite).
2. Lifting device weight (if over 100 lb).
3. Serial number (if applicable).
4. Rated capacity.

b. A rerated lifting device shall be relabeled with the new rated capacity.

c. Cases may exist where a lifting device cannot be marked with its rated capacity and weight. This may be due to the security classification of the load to be lifted or other reasons approved by the responsible manager. In these cases, the lifting device shall be marked with an identification number, and its documentation shall describe both its rated capacity and weight.

14.2.3 Modification/Rerating

a. Structural and mechanical lifting devices may be modified or rerated if the changes are analyzed by a qualified engineer or the manufacturer of the lifting device.

b. Rerated or modified lift fixtures shall be load-tested as described in Section 14.2.6.2, “Rated Load Test,” below.

14.2.4 Guarding

Exposed moving parts or pinch points, such as gearing, chain drives, and rotating shafts, that may be a hazard to personnel during lifting operations shall be guarded.

14.2.5 Inspections

14.2.5.1 Initial Inspection

Prior to their initial use, a qualified inspector shall inspect all new, modified, or repaired lifting devices to ensure compliance with Section 14.2.5.3, “Periodic Inspection.”

14.2.5.2 Frequent Inspection

a. The operator or other designated person shall visually inspect each lifting device at the beginning of each shift or prior to use, if it has not been in regular service, for the following items or conditions (records are not required):

1. Structural deformation, cracks, or excessive wear on any part.
2. Loose or missing guards, fasteners, covers, stops, or nameplates.
3. All operating mechanisms and automatic hold-and-release mechanisms for misadjustments interfering with operation.

b. The operator or designated person shall carefully examine any deficiencies and determine whether they constitute a hazard. Deficiencies noted during the inspection shall be corrected before the lifting device is used.
Figure 14-1. Load-supporting lifting devices.

Figure 14-2. Friction-type pressure gripping lifting devices.
Chapter 14
Below-the-Hook Lifting Devices

Figure 14-3. Indentation-type gripping lifting device

Figure 14-4. Typical cask lift fixture.
14.2.5.3 Periodic Inspection

a. A qualified inspector shall perform a complete inspection at the following intervals:

1. Normal service—yearly. Inspect equipment at site of use.

2. Heavy service—semiannually. Inspect equipment at site of use unless external conditions indicate that disassembly should be done to permit detailed inspection.

3. Severe service—quarterly. Inspect equipment at site of use unless external conditions indicate that disassembly should be done to permit detailed inspection.

4. Special or infrequent service—as recommended by a qualified person before the first such use and as directed by the qualified person for any subsequent uses.

b. Lifting device service is defined as follows:

1. Normal—operation with various weights within the rated load limit, or uniform loads less than 65 percent of rated load.

2. Heavy—operation within the rated load limit that exceeds normal service.

3. Severe—operation at normal or heavy service under abnormal operating conditions.

c. This inspection shall include the items listed in Section 14.2.5.2, “Frequent Inspection,” in addition to the following:

1. Loose bolts or fasteners.

2. Cracked or worn gears, pulleys, sheaves, sprockets, bearings, chains, and belts.

3. Excessive wear of friction pads, linkages, and other mechanical parts.

4. Excessive wear at hoist-attaching points and load-support shackles or pins.

5. External evidence of damage to motors or controls.

d. A qualified inspector shall inspect fixtures not in regular use according to periodic inspection requirements before placing them in service.

e. Dated reports of each periodic inspection shall be prepared. They shall be kept on file and shall be readily available. A sample load test and inspection form is included as Exhibit I at the end of this section. This form is intended to be a sample only and is not intended to be mandatory.

14.2.6 Testing

14.2.6.1 Operational Test

a. Modified or repaired lifting devices shall be tested before initial use to ensure compliance with the requirements of this section (test reports kept on file). Testing shall include the following:

1. Lifting devices with moving parts shall be tested to confirm that the lifting device operates in accordance with manufacturer’s instructions.

2. Lifting devices with manually operated or automatic latches shall be tested to verify that the latches operate in accordance with manufacturer’s instructions.

14.2.6.2 Rated Load Test

a. All new, altered, modified, or repaired lifting devices shall be tested and inspected before use. The results of the test and inspection shall be documented in the equipment history file.

b. The rated capacity shall not be more than 80 percent of the maximum load sustained during the test. Test loads shall not be more than 125 percent of the rated capacity unless otherwise recommended by the manufacturer.

c. The rated load test shall consist of the following:

1. Hoist the test load a sufficient distance to ensure that it is supported by the lifting device, or apply the required load if the test is made using a testing machine. Personnel shall remain clear of suspended loads.

2. Visually inspect the lifting device for deformation, cracks, or other defects after the load test is completed.
14.2.7 Maintenance

a. A preventive maintenance program should be established and be based on recommendations made by the lifting device manufacturer or a qualified person.

b. Replacement parts shall be equivalent to the original specifications.

14.2.8 Training/Qualification

a. Below-the-hook lifting device operators shall be trained and qualified as required in Chapter 6, “Personnel Qualification and Training.” At a minimum, instruction should include the following:

1. Application of the lifting device to the load and adjustments to the device, if any, that adapt it to various sizes or kinds of loads.

2. Any special operations or precautions.

3. Condition of the load itself required for operation of the lifting device such as balance, degree of order of stacked loads, surface cleanliness, bending, and load thickness.

4. Procedure for storage of lifting device to protect it from damage.

5. Instructions for not exceeding the rated capacity of the lifting device or the capacity of the hoisting equipment by the combined weight of the load, the lifting device, and the rigging.

b. Operators shall demonstrate the ability and competence to operate the lifting device as instructed before assuming responsibility for using it.

14.2.9 Operation

a. Only the following personnel shall operate structural and mechanical lifting devices:

1. Qualified operators or riggers.

2. Trainees under the direct supervision of a qualified operator.

3. Maintenance and test personnel, when it is necessary in the performance of their duties.

4. Inspectors of lifting devices.

b. The following shall apply to all personnel who operate structural and mechanical lifting devices:

1. Observe the condition of the lifting device before use and during operation. If you observe a defect that affects the continued safe use of the lifting device, remove it from service.

2. Place any attached load on the floor or ground and, after use, properly store the lifting device before leaving.

3. Before they are used on each shift, test the lifting device controls. If any controls do not operate properly, adjust or repair them before operations begin.

4. Do not load the lifting device in excess of its rated capacity (except for test loads) or handle any load for which it is not designed.

5. Apply the lifting device to the load in accordance with established procedures.

6. Before lifting, ensure that lifting-device ropes or chains are not kinked and multiple-part lines are not interwoven.

7. Ensure that the load is correctly distributed for the lifting device being used.

8. Do not use the lifting device for side pulls or sliding the load unless specifically authorized by a qualified person or by an approved procedure.

9. Do not use a lifting device that is tagged “Danger—Do Not Operate” or otherwise designated as nonfunctional.

10. Do not remove “Danger—Do Not Operate” tags from lifting devices without the approval of the person who placed them or an authorized person.

11. Store the lifting device in a dry, inside location when not in use.

12. Ensure that markings or tags are not removed or defaced. Replace missing or defaced markings or tags.
14.3 VACUUM LIFTING DEVICES

Typical power-operated and mechanically operated vacuum lifting and manipulating devices are shown in Figures 14-5 and 14-6. This section does not cover devices used to handle porous materials, which requires special design and construction.

14.3.1 Design/Fabrication

Power- and mechanically operated vacuum lifting devices shall be designed and fabricated according to the provisions of ASME B30.20, 20-2.2.2.

14.3.2 Marking

a. The rated capacity, maximum width and length, and minimum thickness of load shall be marked on the main structure where it is visible and legible.

b. Individual pads or groups of pads, controlled by shutoff valves, shall be marked with the rated capacity of each pad or group of pads.

c. At a minimum, a nameplate, name tag, or other permanent marker shall be affixed to each lifter displaying the following data:
   1. Manufacturer's name.
   2. Model number or unit identification.
   3. Weight of lifting-device.
   4. Electric power (when applicable).
   5. Pressure and volume of compressed air (when applicable).
   6. Rated capacity.

d. Manual shutoff valves on individual pads or groups of pads shall be marked to show operating position.

e. Cases may exist where a lifting device cannot be marked with its rated capacity and weight. This may be due to the security classification of the load to be lifted or other reasons approved by the responsible manager.

In these cases, the lifting device shall be marked with an identification number, and its documentation shall contain both its rated capacity and weight.

f. A label or labels shall be affixed to each vacuum lifting device in a readable position that displays the word “WARNING” or other legend designed to bring the label to the attention of the operator. The label shall also contain information cautioning against:

1. Exceeding the rated capacity or lifting loads not specified in the manufacturer's instruction manual.
2. Operating a damaged or malfunctioning unit or a unit with missing parts.
3. Operating when vacuum indicators show insufficient vacuum.
4. Operating the unit when vacuum pads are not spaced for equal loading.
5. Incorrect positioning of the lifting device on the load.
8. Removing/obscuring warning labels.
9. Operating the lifting device when the rated capacity, lifting-device weight, or safety markings are missing (except in cases where the device cannot, for security or other reasons, be marked).
10. Making alterations or modifications to the lifting device.
11. Lifting loads higher than necessary and leaving suspended loads unattended.

g. A label shall be affixed to each unit that directs the user to consult the manufacturer's manual if the size or shape of the unit prohibits the inclusion of the above markings.
Figure 14-5. Powered vacuum lifting devices.

Figure 14-6. Mechanical vacuum lifting devices.
14.3.3 Installation

a. Vacuum lifting devices shall be assembled and installed in accordance with the manufacturer's instructions.

b. The power supply to the vacuum lifting device shall be the same as that shown on the nameplate and shall be connected to the line side of the crane disconnect or to an independent circuit.

c. The user shall check for correct rotation of all pumps.

14.3.4 Inspections

14.3.4.1 Initial Inspection

Prior to their initial use, a qualified inspector shall inspect all new or repaired vacuum lifting devices to ensure their compliance with Section 14.3.4.3, “Periodic Inspection.”

14.3.4.2 Frequent Inspection

a. The operator or other designated person shall inspect each vacuum lifting device at the beginning of each shift or prior to use, if it has not been in regular service.

b. The inspection shall be for the following (records are not required):

1. Deformation, cracks, and excessive wear of load-bearing parts.
2. Adequate vacuum generator output.
3. Cuts, tears, excessive wear, and foreign particles at vacuum pad seal rings.
4. Leakage, cuts, kinks, and collapsed areas of vacuum lines/connections.
5. Leaks or damage to the vacuum reservoir.
6. Failure of the entire vacuum system to function properly by attaching a nonporous, clean test plate to the vacuum pads and then stopping the vacuum source. Vacuum levels in the system shall not decrease by more than the manufacturer's specified rate.

14.3.4.3 Periodic Inspection

a. A qualified inspector shall perform a complete inspection at the following intervals:

1. Normal service—yearly. Inspect equipment at site of use.
2. Heavy service—semiannually. Inspect equipment at site of use unless external conditions indicate that disassembly should be done to permit detailed inspection.
3. Severe service—quarterly. Inspect equipment at site of use unless external conditions indicate that disassembly should be done to permit detailed inspection.
4. Special or infrequent service—as recommended by a qualified person before the first use and as directed by the qualified person for any subsequent occurrences.

b. Lifting device service is defined as follows:

1. Normal—operation with various weights within the rated load limit, or uniform loads less than 65 percent of rated load.
2. Heavy—operation within the rated load limit that exceeds normal service.
3. Severe—operation under normal or heavy service with abnormal operating conditions.

c. This inspection shall include those conditions or items specified in Section 14.3.4.2, “Frequent Inspection,” in addition to the following:

1. External evidence of looseness, wear, deformation, cracking, or corrosion.
2. External evidence of damage to supporting structure, motors, controls, and other auxiliary components.
3. Presence of warning label required by Section 14.3.2, “Marking.”

d. A qualified inspector shall inspect fixtures not in regular use according to periodic inspection requirements before placing them in service.
e. Dated inspection reports shall be prepared for each inspection. Inspection records shall be kept on file and shall be readily available.

14.3.5 Testing

14.3.5.1 Operational Test

a. All new, reinstalled, modified, or repaired vacuum lifting fixtures shall be tested prior to use. Tests shall be performed by a qualified inspector or under the direction of that inspector to ensure compliance with the requirements of this section. Dated reports shall be kept on file.

b. Testing shall include the following:

1. Seals and connections shall be tested for leaks by attaching a nonporous, clean test plate to the vacuum pads and then stopping the vacuum source. Vacuum level in the system shall not decrease by more than the rate specified by the manufacturer.

2. Test indicator lights, gauges, horns, bells, pointers, or other warning devices and vacuum level indicators for proper operation.

14.3.5.2 Rated Load Test

a. All new, reinstalled, repaired, or modified vacuum lifting devices shall be tested and inspected before use. Tests and inspections shall be performed by a qualified inspector or under the direction of that inspector. Test and inspection results shall be documented and kept on file.

b. The rated capacity shall not be more than 80 percent of the maximum load sustained during the test. Test loads shall not be more than 125 percent of the rated capacity unless otherwise recommended by the manufacturer.

c. The rated load test shall consist of the following steps at a minimum:

1. Attach pads to the designated test load.

2. Raise the test load a minimum distance to ensure that it is supported by the vacuum lifting device, and hold it for 2 min.

3. Remain clear of the suspended load.

4. Lower and release the load.

5. Visually inspect the vacuum lifting device for defects and correct any deficiencies prior to returning the device to service.

14.3.6 Maintenance

a. A preventive maintenance program should be established and be based on recommendations made by the vacuum lifting device manufacturer or a qualified person.

b. Replacement parts shall be equivalent to the original specifications.

c. The vacuum generator, vacuum pads, sealing rings, mufflers, and filters should be maintained and cleaned according to the manufacturer’s specifications.

14.3.7 Training/Qualification

a. Vacuum lifting device operators shall be trained and qualified as specified in Chapter 6, “Personnel Qualification and Training.” At a minimum, instruction should include the following (as applicable):

1. Application of the lifting device to the load and adjustments of the device, if any, that adapt it to various sizes or kinds of loads.

2. Any special operations or precautions.

3. Condition of the load itself required for operation of the lifting device such as balance, degree of order of stacked loads, surface cleanliness, bending, and load thickness.

4. Procedure for storage of lifting device to protect it from damage.

5. Instructions for not exceeding the rated capacity of the lifting device or the capacity of the hoisting equipment by the combined weight of the load, the lifting device, and the rigging.

6. Charging of the battery (if required).

7. The purpose of indicators, meters, or alarms on the vacuum lifting device.

8. The proper attachment of adaptors to vacuum lifting devices for handling of special loads.
b. Users shall demonstrate the ability and competence to operate the lifting device as instructed before assuming responsibility for using it.

14.3.8 Operation

a. Only the following personnel shall operate vacuum lifting devices:

1. Qualified operators or riggers.

2. Trainees under the direct supervision of a qualified operator.

3. Maintenance and test personnel, when it is necessary in the performance of their duties.

4. Inspectors of lifting devices.

b. The following shall apply to all personnel who operate vacuum lifting devices:

1. Before starting the lift, verify that the “vacuum on” indicator has reached the required level. Also, verify that the vacuum lifting device has been correctly applied and a stable vacuum level exists by lifting the load a few inches and observing conditions.

2. Observe the condition of the lifting device before use and during operation. If you observe a defect that affects the continued safe use of the lifting device, remove it from service.

3. Place any attached load on the floor or ground and, after use, properly store the lifting device before leaving.

4. Before they are used on a shift, test the lifting device controls. If any do not operate properly, adjust or repair them before operations begin.

5. Do not load the lifting device in excess of its rated capacity (except for test loads) or handle any load for which it is not designed.

6. Apply the lifting device to the load in accordance with established procedures.

7. Before lifting, ensure that lifting-device ropes or chains are not kinked and multiple-part lines are not interwoven.

8. Ensure that the load is correctly distributed for the lifting device being used.

9. Do not use the lifting device for side pulls or sliding the load unless specifically authorized by a qualified person or by an approved procedure.

10. Warn all personnel in the vicinity of the lifting device and place the load on the floor or ground, if possible to do so, if electrical power goes off while a load is being lifted.

11. Do not leave your position at the controls.

12. Do not use a lifting device that is tagged “Danger—Do Not Operate” or otherwise designated as nonfunctional.

13. Do not remove “Danger—Do Not Operate” tags from lifting devices without the approval of the person who placed them or an authorized person.

14. Store the lifting device in a dry, inside location when not in use.

15. Ensure that markings or tags are not removed or defaced. Replace missing or defaced markings or tags.
14.4 MAGNETS, CLOSE-PROXIMITY-OPERATED

Close-proximity-operated magnetic lifting devices are used for single- or multiple-steel-piece handling operations in which the operator of the magnet is required to manually guide the load during its movement. They are also used in situations where remotely operated magnets are operated close to people. Typical close-proximity-operated magnetic lifting devices are shown in Figure 14-7.

14.4.1 Design/Fabrication

Close-proximity-operated magnetic lifting devices shall be designed and fabricated in accordance with the provisions of ASME B30.20, 20-3.2.2 and 20-3.2.3.

14.4.2 Marking

a. At a minimum, a nameplate, name tag, or other permanent marker shall be affixed to each lifting magnet, and shall display the following data:

1. Manufacturer’s name, or if the magnet has been repaired or modified, the name and address of the repairer/modifier.
2. Model or unit identification.
3. Weight.
4. Duty cycle, if applicable.
5. Cold current.
6. Rated capacity.

b. Also, battery-powered and external-powered lifting electromagnets and electrically controlled permanent-magnet lifting magnets shall be marked with:

1. The voltage of the battery or primary power supply.
2. The cold current or watts at 68 degrees F (20 degrees C) and rated voltage.

c. Cases may exist where a lifting device cannot be marked with its rated capacity and weight. This may be due to the security classification of the load to be lifted or other reasons approved by the responsible manager. In these cases, the lifting device shall be marked with an identification number, and its documentation shall contain both its rated capacity and weight.

d. A label or labels shall be affixed to each lifting magnet in a readable position that displays the word “CAUTION” or other legend designed to bring the label to the attention of the operator. The label shall also contain information cautioning against:

1. Operating when the battery capacity is inadequate.
2. Exceeding magnet duty cycle and disconnecting the magnet with the power on (for externally powered electromagnets).
3. Operating if the internal control function indicator, where applicable, does not indicate a complete cycle (on electrically controlled permanent magnets).
4. Operating with the control handle not fully in the “Lift” position (on manually controlled permanent magnets).

14.4.2.1 Rated Load (Capacity)

a. General-application magnets shall include the rated load (capacity) of the magnet on the lifting magnet or on a tag attached to it. This capacity rating shall refer to the instruction manual for information relating to decreases in rating due to the load surface condition, thickness, percentage of contact with magnet, temperature, metallurgical composition, and deflection.

b. Specified-application magnets shall include the application load (capacity) of the magnet on the lifting magnet or on a tag attached to it. This capacity rating shall refer to the specific loads for which it applies.

14.4.2.2 Controls

The position of the control switch or handle of a lifting magnet shall be marked with “Lift,” “Off,” and “Drop,” or equivalent terms indicating the mode of operation of the lifting magnet.

14.4.3 Installation

a. Close-proximity-operated magnetic lifting devices shall be installed according to the manufacturer’s recommendations.

b. Users shall ensure that:
Close-proximity-operated lifting electromagnet

Close-proximity-operated manually controlled permanent magnet

Close-proximity-operated electrically controlled permanent magnet

Figure 14-7. Close-proximity-operated magnetic lifting devices.
1. External power input is the correct voltage and amperage.

2. Power conductors and controls are of adequate rating and are insulated or otherwise protected against accidental interruption or damage.

14.4.4 Inspections

14.4.4.1 Initial Inspection

Prior to their initial use, a qualified inspector shall inspect all new, modified, or repaired lifting magnets to ensure compliance with Section 14.4.4.3, “Periodic Inspection.”

14.4.4.2 Frequent Inspection

a. The operator or other designated person shall visually inspect each magnetic lifting device at the beginning of each shift or prior to use, if it has not been in regular service.

b. The inspection shall be for the following (records are not required):

1. Lifting magnet face for freedom from foreign materials and for smoothness.

2. Lifting bail or sling suspension for proper condition.

3. Control handle for proper condition and operation.

4. Current indicator, where applicable, for proper condition and operation.

5. Labels, markings, and indicators or meters for legibility.

6. Electrical conductors, if applicable, for loose connections, continuity, corrosion, and damage to insulation.

7. Battery for correct electrolyte level and lack of corrosion of battery posts or connectors, if applicable.

14.4.4.3 Periodic Inspection

a. A qualified inspector shall perform a complete inspection with the equipment in place at the following intervals:

1. Normal service—yearly.

2. Heavy service—yearly.

b. Lifting device service is defined as:

1. Normal—operation with various weights within the rated load limit, or uniform loads less than 65 percent of rated load.

2. Heavy—operation within the rated load limit that exceeds normal service.

3. Severe—operation under normal or heavy service with abnormal operating conditions.

c. This inspection shall include those items specified in Section 14.4.4.2, “Frequent Inspection,” in addition to the following:

1. Deformation, wear, and corrosion of all members, fasteners, locks, switches, warning labels, and lifting parts.

2. Operation and condition of electrical components (i.e., meters, indicators, and alarms).

3. Magnet coil tested for ohmic/ground readings and readings compared to manufacturer’s standards.

d. A qualified inspector shall inspect a lifting magnet that has been idle for 1 month or more according to periodic inspection requirements before placing it in service.

e. Dated inspection reports shall be prepared for each inspection. Inspection records shall be kept on file and shall be readily available.

14.4.5 Testing

14.4.5.1 Operational Test

a. All new, modified, or repaired lifting magnets shall be tested prior to their initial use. Tests shall be performed by a qualified inspector or under the direction of that inspector. Dated reports shall be kept on file.

b. Testing shall include the following:

1. A check to ensure that the lifting magnet contains no visible defects.

2. A check for proper operation of all electrical protective equipment, meters, indicators, alarms, etc.

14.4.5.2 Rated Load Test

a. All new, modified, or repaired lifting magnets shall be tested and inspected before initial use. Tests and inspections shall be
performed by a qualified inspector or under the direction of that inspector. Test and inspection results shall be documented and kept on file.

b. General-application magnets are required to satisfy the rated breakaway-force test. The breakaway force measured in this test must exceed the rated load (capacity) by a factor of at least 2.

c. Specified-application magnets are required to comply with the application breakaway-force test. The breakaway forces measured in this test must exceed the specified application load (capacity) by a factor of at least 2.

d. The rated breakaway-force test shall establish the breakaway force required to vertically remove the lifting magnet from a low-carbon rolled-steel plate of the minimum thickness stated by the magnet manufacturer. The portion of this plate in contact with the magnet shall have a 125-µin. (3.2 × 10^{-3} \text{ mm}) finish and be flat within 0.002 in./ft (0.05 mm/m), but not exceeding 0.005 in. (0.127 mm) total. The full operating face of the lifting magnet shall be in contact with the steel plate, which shall be between 60 degrees F (15 degrees C) and 120 degrees F (50 degrees C). Battery-operated electromagnets and external-powered lifting electromagnets shall be operated at the manufacturer's recommended current.

e. The application breakaway-force test shall establish the application breakaway forces of the lifting magnet under the variety of loading conditions for which the magnet is specified. The details of this test should be supplied by the manufacturer of the lifting magnet.

**14.4.6 Maintenance**

a. A preventive maintenance program should be established and be based on recommendations made by the manufacturer or a qualified person.

b. Replacement parts shall be equivalent to the original specifications.

c. Before adjustment and repairs are started on a lifting magnet or its controls, maintenance personnel shall take the following precautions:

1. Ensure that all sources of magnet power are disconnected and locked out, tagged out, or flagged.

2. Ensure that a magnet removed for repair is tagged as defective.

d. Only qualified personnel shall work on equipment when adjustments and tests are required.

e. After adjustments and repairs have been made, the lifting magnet shall not be returned to service until it has been inspected according to Section 14.4.4.3.

f. Dated records of repairs and replacements should be available.

g. Maintenance personnel shall ensure that any defective condition disclosed by the inspection is corrected before operation of the lifting magnet is resumed. Repairs shall be done only by designated persons.

**14.4.7 Training/Qualification**

a. Magnetic lifting device operators shall be trained and qualified as specified in Chapter 6, “Personnel Qualification and Training.” At a minimum, instruction should include the following:

1. Application of the lifting device to the load and adjustments of the device, if any, that adapt it to various sizes or kinds of loads.

2. Any special operations or precautions.

3. Condition of the load itself required for operation of the lifting device such as balance, degree of order of stacked loads, surface cleanliness, bending, and load thickness.

4. Procedure for storage of lifting device to protect it from damage.

5. Instructions for not exceeding the rated capacity of the lifting device or the capacity of the hoisting equipment by the combined weight of the load, the lifting device, and the rigging.

6. Charging of the lifting magnet battery (if required).

7. The purpose of indicators, meters, or alarms on the lifting magnet.

8. The proper attachment of adaptors to lifting magnets for handling of special loads.

b. Operators shall demonstrate the ability and competence to operate the lifting device as instructed before assuming responsibility for using it.
14.4.8 Operation

a. Only the following qualified personnel shall operate lifting devices:

1. Designated persons.

2. Trainees under the direct supervision of a designated person.

3. Maintenance and test personnel, when it is necessary in the performance of their duties.

4. Inspectors of lifting devices.

b. The following shall apply to personnel who use close-proximity-operated magnets:

1. Place any attached load on the floor or ground and, after use, properly store the lifting device before leaving it.

2. Before they are used during a shift, test all controls. If any do not operate properly, adjust or repair them before operations begin.

3. Do not load the lifting device in excess of its rated capacity or handle any load for which it is not designed.

4. Apply the lifting device to the load in accordance with established procedures.

5. Before lifting, ensure that lifting-device ropes or chains are not kinked and that multiple-part lines are not interwoven.

6. Ensure that the load is correctly distributed for the lifting device being used.

7. Ensure that the temperature of the load does not exceed the maximum allowable limits of the lifting device.

8. Do not use the lifting device for side pulls or sliding the load unless specifically authorized by a qualified person.

9. Keep the lifting magnet face and the magnet contact area clean.

10. Ensure that the load to be lifted is within the magnet’s rated capacity or application capacity and lifting equipment rated capacity.

11. Observe all meters and indicators on the lifting magnet to confirm proper operation prior to making a lift.

12. Before starting the lift, lift the load a few inches to establish that it is securely attached to the magnet.

13. Do not use a lifting magnet that is tagged “Danger—Do Not Operate” or otherwise designated as nonfunctional.

14. Do not remove “Danger—Do Not Operate” tags from magnetic lifting devices without the approval of the person who placed them or an authorized person.

15. Store the lifting device in a dry, inside location when not in use.

14.4.8.1 External-Powered Electromagnets

Before raising the load more than 2 in. (50 mm), ensure that any adjustable input control is switched to the “FULL POWER” or “FULL ON” position and remains in this position until the load is removed from the magnet.

14.4.8.2 Battery-Operated Electromagnets

a. Before lifting, confirm that the device indicating correct current flow remains stable for a minimum of 5 sec.

b. For a lift of extended duration, observe the device indicating correct current flow every 5 min.

c. Open the ventilation lid before charging the battery.

d. Before raising the load more than 2 in. (50 mm), ensure that any adjustable input control is switched to the “FULL POWER” or “FULL ON” position and remains in this position until the load is removed.

14.4.8.3 Electrically Controlled Permanent Magnets

Before raising the load, check the internal control function indicator, where applicable, to confirm proper operation of the lifting magnet.

14.4.8.4 Manually Controlled Permanent Magnets

Before raising the load, confirm that the control handle is in the “LIFT” or “ON” position and the control handle latch is operating.
14.5 MAGNETS, REMOTE-OPERATED

Typical remote-operated magnetic lifting devices are shown in Figure 14-8.

14.5.1 Design/Fabrication

Remote-operated magnetic lifting devices shall be designed and fabricated in accordance with the provisions of ASME B30.20, 20-4.2.2.

14.5.2 Marking

a. At a minimum, all new lifting magnets shall be provided with a nameplate, name tag, or other permanent marker displaying the following information:
   1. Manufacturer's name and address, or if the magnet has been repaired or modified, the name and address of the repairer/modifier.
   2. Manufacturer's model or unit identification.
   3. Weight.
   4. Duty cycle, if applicable.
   5. Cold current.

b. Cases may exist where a lifting device cannot be marked with its rated capacity and weight. This may be due to the security classification of the load to be lifted or other reasons approved by the responsible manager. In these cases, the lifting device shall be marked with an identification number, and its documentation shall contain both its rated capacity and weight.

14.5.3 Installation

a. Remote-operated magnets shall be installed according to the manufacturer's recommendations.

b. Operators shall ensure that:
   1. External power input is of the correct voltage and amperage.
   2. Power conductors and controls are of adequate rating and are insulated or otherwise protected against accidental interruption or damage.

14.5.4 Inspections

14.5.4.1 Initial Inspection

Prior to their initial use, a qualified inspector shall inspect all new, modified, or repaired lifting magnets to ensure compliance with Section 14.5.4.3, “Periodic Inspection.”

14.5.4.2 Frequent Inspection

a. The operator or other designated personnel shall visually inspect each magnetic lifting device at the beginning of each shift or prior to use, if it has not been in regular service.

b. The inspection shall be for the following (records are not required):
   1. Lifting magnet face for smoothness or presence of foreign materials, if applicable.
   2. Magnet suspension system.
   3. All visible electrical conductors (without disassembly).

14.5.4.3 Periodic Inspection

a. A qualified inspector shall perform a complete inspection of the lifting device with the equipment in place at the following intervals:
   1. Normal service—yearly.
   2. Heavy service—quarterly.
   4. Special or infrequent service—as authorized by a qualified person before the first use and as directed by the qualified person for any subsequent occurrences.
Remote-operated lifting electromagnet -- circular

Remote-operated lifting
Electromagnet -- rectangular

Figure 14-8. Remote-operated magnetic lifting devices.
b. Lifting device service is defined as follows:

1. Normal—operation with various weights within the rated load limit, or uniform loads less than 65 percent of rated load.

2. Heavy—operation within the rated load limit that exceeds normal service.

3. Severe—operation under normal or heavy service with abnormal operating conditions.

c. This inspection shall include those items specified in Section 14.5.4.2, “Frequent Inspection,” in addition to the following:

1. Deformation, wear, and corrosion of all members, fasteners, and lifting parts.

2. Proper operation and condition of electrical components.

3. Magnetic coil tested for ohmic/ground readings and compared to manufacturer's standards.

d. Dated inspection reports shall be prepared for each inspection. Inspection records shall be kept on file and shall be readily available.

14.5.5 Testing

14.5.5.1 Operational Test

a. All new, modified, or repaired lifting magnets shall be tested prior to initial use. Tests shall be performed by a qualified inspector or under the direction of that inspector. Dated reports shall be kept on file.

b. Testing shall include the following:

1. A check for proper operation of all electrical equipment.

2. A visual inspection of the lifting magnet for visible defects.

14.5.6 Maintenance

a. A preventive maintenance program should be established and be based on the recommendations of the manufacturer or a qualified person.

b. Replacement parts shall be equivalent to original specifications.

c. Before maintenance is started on a lifting magnet or controls, maintenance personnel shall take the following precautions:

1. Ensure that all sources of magnet power are disconnected and locked out, tagged out, or flagged.

2. Ensure that a magnet removed for repair is tagged as defective.

d. Only qualified personnel shall work on equipment when maintenance and tests are required.

e. After repairs have been made, the lifting magnet shall not be returned to service until it has been inspected according to Section 14.5.4.3.

f. Dated records of repairs and replacements should be available.

g. Any defective condition disclosed by the inspection shall be corrected before the lifting magnet is returned to service.

14.5.7 Training/Qualification

a. Operators shall be trained and qualified as specified in Chapter 6, “Personnel Qualification and Training.” At a minimum, instruction should include the following:

1. Application of the lifting device to the load and adjustments of the device, if any, that adapt it to various sizes or kinds of loads.

2. Any special operations or precautions.

3. Condition of the load itself required for operation of the lifting device, such as balance, degree of order of stacked loads, surface cleanliness, bending, and load thickness.

4. Procedure for storage of the lifting device to protect it from damage.

5. Instructions for not exceeding the rated capacity of the lifting device or the capacity of the hoisting equipment by the combined weight of the load, the lifting device, and the rigging.

6. Charging of the lifting magnet battery
7. The purpose of indicators, meters, or alarms on the lifting magnet.

8. The proper attachment of adaptors to lifting magnets for handling of special loads.

b. Operators shall demonstrate the ability and competence to operate the lifting device as instructed before assuming responsibility for using it.

14.5.8 Operation

a. Only the following qualified personnel shall operate lifting devices:

1. Designated persons.

2. Trainees under the direct supervision of a designated person.

3. Maintenance and test personnel, when it is necessary in the performance of their duties.

4. Inspectors of lifting devices.

b. The following shall apply to all personnel who operate remote-operated magnets:

1. Place any attached load on the floor or ground and, after use, properly store the lifting device before leaving it.

2. Before they are used during a shift, test all controls. If any do not operate properly, adjust or repair them before operations begin.

3. Do not load the lifting device in excess of its rated capacity or handle any load for which it is not designed.

4. Apply the lifting device to the load in accordance with established procedures.

5. Before lifting, ensure that lifting-device ropes or chains are not kinked and that multiple-part lines are not interwoven.

6. Ensure that the load is correctly distributed for the lifting device being used.

7. Ensure that the temperature of the load does not exceed the maximum allowable limits of the lifting device.

8. Do not use the lifting device for side pulls or sliding the load unless specifically authorized by a qualified person.

9. Do not use a lifting magnet that is tagged “Danger—Do Not Operate” or otherwise designated as nonfunctional.

10. Do not remove “Danger—Do Not Operate” tags without the approval of the person who placed them or an authorized person.

11. Store the lifting device in a designated location when not in use.
Exhibit I is intended to be a sample form only and is not mandatory. Any other form that accomplishes the purpose is acceptable.
LIFTING BARS AND SPREADERS LOAD TEST AND INSPECTION

INSPECTOR ____________________________   INSPECTION DATE ____________________________

NOTES:  
1. Proof-test to 200% of rated capacity for critical lift service. The test load shall be accurate to within -5%, +0% of stipulated values.
2. Qualified inspector shall witness all steps below.

INSPECTION

Lifting bars and spreaders shall be checked for signs of incipient failure in bending and shall be replaced if permanently bent more than 1/2 in. in 10 ft or twisted more than 5 degrees out of the original plan. Hook attachment welds shall be examined for cracks and signs of failure in tension.

Qualified inspector shall perform test by visual examination, liquid-penetrant examination, or magnetic-particle examination.

Acceptance: No cracks, linear indication, laps, or seams.

STATIC TEST: Hold weight for 10 min and visually inspect for deformation.

15.1 GENERAL

The versatility of hoisting and rigging equipment makes it extremely useful on construction projects. Improper and unsafe use, however, can result in serious accidents.

This chapter is designed for use as a stand-alone document and may be used as part of the procurement process. It outlines minimum requirements for the safe use of hoisting and rigging equipment on construction projects at DOE installations.
15.2 DEFINITIONS

APPPOINTED: Assigned specific responsibilities by the employer or the employer’s representative.

AUTHORIZED: Assigned by a duly constituted administrative or regulatory authority to perform a specific function.

CRANE, MOBILE: For the purposes of this chapter, mobile cranes are defined as wheel-mounted cranes, truck cranes, and crawler cranes.

- A wheel-mounted crane consists of a rotating structure with power plant, operating machinery, and boom, mounted on a base or platform equipped with axles and rubber-tired wheels for travel. The base is usually propelled by an engine in the superstructure, but it may be equipped with a separate engine controlled from the superstructure (see Figures 15-1, 15-3, 15-5, 15-6, 15-7, 15-9, and 15-10).

- A truck-mounted crane consists of a rotating superstructure with power plant that operates machinery and boom, mounted on an automotive truck equipped with a power plant for travel. Commercial truck-mounted cranes are included in this category (see Figures 15-3, 15-7, 15-9, and 15-10).

- A crawler crane consists of a rotating superstructure with power plant, operating machinery and boom, mounted on a base equipped with crawler treads for travel (see Figures 15-2 and 15-8).

CRITICAL ITEM: A part, assembly, component, or piece of equipment designated as critical by the responsible management, because its dropping, upset, or collision could: (a) cause damage that would result in schedule delay; (b) cause undetectable damage that could jeopardize future operation or the safety of the facility; or (c) result in significant release of radioactivity or other undesirable material. Critical items may include pumps, heat exchangers, piping subassemblies, other primary-system components, fuel assemblies, large radiation-shielded shipping casks, or other items which require special care in handling because of size, weight, installation in close-tolerance receptors, fragility, extreme susceptibility to damage, or other unusual factors.

CRITICAL SERVICE: The use of equipment or accessories for hoisting, rigging, or handling critical items.

DESIGNATED: Selected or assigned by the employer or the employer’s representative as being qualified to perform specific duties.

DESIGNATED LEADER: “An individual assigned responsibility for hoisting and rigging activities requiring more than one person”.

FORKLIFT TRUCK: A high-lift self-loading truck equipped with load carriage and forks for transporting and tiering loads (see Figure 15-11).

LIFT, CRITICAL: Lifting of parts, components, assemblies, or other items designated as critical by the responsible management because the effect of dropping, upset, or collision of them could:

- Cause significant work delay
- Cause undetectable damage resulting in future operational or safety problems
- Result in significant release of radioactivity or other undesirable conditions
- Present a potentially unacceptable risk of personnel injury or property damage.
Figure 15-1. Wheel-mounted crane (single control station).

Figure 15-2. Crawler crane.

Figure 15-3. Wheel-mounted crane (Multiple control station).

Figure 15-4. Locomotive crane.
General note for Figures 15-5 through 15-10:

The boom may have a base boom structure of sections (upper and lower) between or beyond which additional sections may be added to increase its length, or it may consist of a base boom from which one or more boom extensions are telescoped for additional length. These illustrations show some types.
Figure 15-9. Commercial truck-mounted crane -- telescoping boom.

Figure 15-10. Commercial truck-mounted crane -- nontelescoping boom.

Figure 15-11. High-lift truck, counterbalanced truck, Cantilever truck, rider truck, forklift truck.
**LIFT, ORDINARY:** Any lift not designated as a critical lift.

**PERSON-IN-CHARGE (PIC):** The manager or other responsible person (other than the equipment operator) known to be qualified and appointed to be responsible for the safe handling of critical loads and for the safe handling of noncritical loads in, around, or above spaces in which critical items are located.

**QUALIFIED:** A person, who, by possession of a recognized degree or certificate, or by professional standing, or who, by extensive knowledge, training, and experience, has successfully demonstrated an ability and competence to solve problems relating to the subject matter and work.

**QUALIFIED ENGINEER/QUALIFIED ENGINEERING ORGANIZATION:** An engineer or engineering organization whose competence in evaluation of the type of equipment in question has been demonstrated to the satisfaction of the responsible manager.

**QUALIFIED INSPECTOR:** One whose competence is recognized by the authority having jurisdiction and whose qualification to perform specific inspection activities has been determined, verified, and attested to in writing.

**QUALIFIED OPERATOR:** One whose competence to operate equipment safely and effectively (including the ability to accurately spot and control loads) can be demonstrated to and accepted by responsible management.

**QUALIFIED RIGGER:** One whose competence in this skill has been demonstrated by experience accepted as satisfactory by the responsible manager.
15.3 PERSONNEL QUALIFICATIONS

15.3.1 Qualified Operators of Mobile Cranes

a. Only qualified personnel or trainees, under the direct supervision of qualified personnel, who meet the following physical qualifications and requirements shall be allowed to operate mobile cranes:

1. Be at least 18 years of age.
2. Understand spoken and written English.
3. Have vision of at least 20/30 Snellen in one eye, and 20/50 in the other, with or without corrective lenses.
4. Be able to distinguish colors, regardless of position, if color differentials required for operation.
5. Have adequate hearing, with or without a hearing aid, for a specific operation.
6. Have physical strength, coordination, and sufficient reaction speed to meet the demands of equipment operation.
7. Show no evidence of physical defects or of emotional instability that could be a hazard to themselves or others, or which, in the opinion of the examiner, could interfere with their safe performance; such evidence may be sufficient cause for disqualification. In these cases, medical judgments and test may be required.
8. Show no evidence of being subject to seizures or loss of physical control; such evidence shall be sufficient reason for disqualification. Medical examinations may be required to determine these conditions.
9. Have normal depth perception, field of vision, manual dexterity, coordination, and no tendencies to dizziness or similar potentially hazardous characteristics.
10. Have no detectable or known disease or physical restriction that would render them incapable of safely operating equipment. Where any deficiency of an upper or lower extremity exist, the acceptability of a candidate shall be the decision of the supervisor, after consulting with the designated physician.
11. Shall successfully pass with a negative result, a substance abuse test. The level of testing will be determined by the standard practice for the industry where the crane is employed and this test shall be confirmed by a recognized laboratory service.
12. Operator physical examinations shall be required every three years or more frequently if supervision deems it necessary.

b. Prior to allowing mobile crane operations at DOE installations, the construction manager shall implement a program or ensure that the construction contractor has an acceptable program to evaluate crane operator qualifications. This program shall include written testing to evaluate operator knowledge and performance (“hands-on”) testing to evaluate operator skills. These tests shall include, but not be limited to applicable elements of the following:

1. Pre-use crane inspection.
2. The crane's specifications, operator's manual, charts (e.g., load charts, work area charts), instrumentation, controls, operator aids, and operating characteristics.
3. Operating procedures under emergency conditions.
4. Set-up, shut-down and parking of the crane.
5. Crane attachments (e.g., jibs, boom extensions, heavy lift equipment).
6. Configurations and loading effects on the crane.
7. Standards, rules and regulations (e.g., hand signals, distances for working around electrical power lines).
8. Rigging practices.

NOTE: The means of determining operator qualifications shall be included in the contract.
documents. Contract documents shall also include requirements for maintenance of testing records. Consideration should be given to local, state, or federal crane operator licensing requirements within the work jurisdiction as well as certification programs administered by recognized private organizations.

15.3.2 Qualified Operators of Forklift Trucks

a. Physical qualifications shall be based on specific job requirements.

b. Operators shall be required by the employer to pass a practical operating skill evaluation. Qualification shall be limited to the type of forklift for which the operator is being evaluated.

c. The actual or simulated operation shall enable operators to demonstrate basic knowledge and skills at a level that ensures the safety of personnel and equipment.

d. Only qualified and authorized operators shall be permitted to operate powered forklift trucks. Operator trainees may operate powered forklift trucks under the direct supervision of a qualified operator or trainer and only where such operations does not endanger the trainee or other employees.

e. The initial training of operators shall include:

1. A combination of formal instruction (e.g., lecture, discussion, interactive computer learning, video tape, written material).

2. Practical training (demonstrations performed by the trainer and practical exercises performed by the trainee).

3. Evaluation of the operator’s performance in the workplace including results of written and oral evaluation, and witnessing a demonstration of the operator's skills.

f. The following checklist contains basic factors with which a forklift truck operator should be familiar. This checklist must be tailored to suit actual conditions.

1. Operating instruction, warnings, and precautions for the type of forklift truck the operator will be authorized to operate.

2. Differences between the forklift truck and the automobile.

3. Forklift truck controls and instrumentation:
   i. Where they are located.
   ii. What they do.
   iii. How they work.

4. Engine or motor operation.

5. Steering and maneuvering.

6. Visibility, including restrictions due to loading.

7. Fork and attachment adaptation, operation, and use limitations.

8. Forklift truck capacity and load weight determination.

10. Forklift truck inspections and maintenance that the operator will be required to perform.

11. Refueling and/or charging and recharging of batteries.

12. Operating limitations.

13. Any other operating instructions, warning, or precautions listed in the operator’s manual for the type of forklift truck that the employee is being trained to operate.

g. Refresher training in relevant topics shall be provided to the operator when:

1. The operator has been observed to operate the forklift truck in an unsafe manner.

2. The operator has been involved in an accident or near-miss incident.

3. The operator has received an evaluation that reveals that the operator is not operating the forklift truck safely.

4. The operator is assigned to drive a different type of forklift truck.

5. A condition in the workplace changes in a manner that could affect the safe operation of the forklift truck.

Chapter 15
Construction Hoisting and Rigging
Equipment Requirements 15-8
15.3.3 Qualified Riggers

Qualified riggers shall meet the following requirements:

a. Be at least 18 years of age.

b. Understand spoken and written English.

c. Have basic knowledge and understanding of equipment-operating characteristics, capabilities, and limitations. Understand rigging principles as applied to the job for which they are to be qualified.

d. Demonstrate to appropriate management personnel skill in using rigging principles.

e. Be free of any detectable or known disease or physical restriction that would render them incapable of safe operation or rigging duties. Where any loss or loss of function of an upper or lower extremity exists, the acceptability of the candidate shall be the decision of the supervisor, after consulting with the designated physician.

f. Have normal depth perception, field of vision, reaction time, manual dexterity, and coordination.

15.3.4 Person-in-Charge (PIC)

The PIC shall have the necessary knowledge and experience of the specific type of equipment and the hazards of critical lifts to direct the safe completion of the operation. The PIC shall understand the rules and procedures implemented at the site to ensure that the following are completed:

a. Necessary administrative requirements.

b. Personnel assignments and responsibilities.

c. Selection of proper equipment/tools.

d. Recognition and control of hazardous or unsafe conditions.

e. Job efficiency and safety.

f. Critical-lift documentation.

In addition, the PIC shall:

a. Direct operations in the case of an accident.

b. Exercise authority to start and stop work activities.

15.3.5 Designated Leader

The designated leader shall have sufficient knowledge and experience to accomplish the following responsibilities:

a. Ensure that the personnel involved have received proper and current training and qualification for the procedure.

b. Ensure that the equipment and accessories specified in the procedure are available.

c. Survey the lift site for hazardous or unsafe conditions.

d. Ensure that equipment is properly set up and positioned.

e. Ensure that a signaler is assigned, if required, and is identified to the operator.

f. Direct the lifting operation to ensure that the job is done safely and efficiently.

g. Stop the job when any potentially unsafe condition is recognized.

h. Direct operations if an accident or injury occurs.
15.4 INSPECTION AND TESTING

15.4.1 General

a. Only equipment that has been built to nationally recognized manufacturers’ standards shall be used at DOE installations. Existing equipment shall be brought to an acceptable level of compliance as determined by the construction management contractor. In some instances, the requirements of this section exceed those of the references and in such instances the requirements of this section shall prevail.

b. Prior to being used at a DOE installation, mobile cranes/boom trucks/forklift trucks shall be inspected and approved for operation by appropriate construction management contractor personnel or those having overall responsibility for ordinary hoisting operations.

c. Equipment with deficiencies that may affect the safety of the operation shall not be allowed to operate at DOE installations. No repairs, modifications, or additions that affect the capacity or safe operation of the equipment shall be made by the contractor without the manufacturer’s written approval. Where manufacturer’s specifications are not available, the limitations assigned to the equipment shall be based on the determinations of a qualified engineer. Dated and signed records shall be kept on file.

d. Mobile cranes, boom trucks, and forklifts that have left the control of the construction management contractor and are then returned shall be reinspected prior to making a critical lift.

15.4.2 Mobile Cranes/Boom Trucks—Inspection

15.4.2.1 Initial Inspection

Prior to initially being used, all new, repaired, or modified cranes shall be inspected by a qualified inspector to ensure their compliance with the applicable provisions of this section. Dated and signed inspection reports shall be kept on file and shall be readily available.

15.4.2.2 Preoperational Check

a. Operators or other designated personnel shall visually inspect items such as the following each day or prior to use if the crane has not been in regular service (records are not required):

1. All control mechanisms for maladjustment interfering with proper operation.

2. Crane hooks and latches for deformation, cracks, and wear.

3. Hydraulic systems for proper oil level.

4. Lines, tanks, valves, pumps, and other parts of air or hydraulic systems for leakage.

5. Hoist ropes for kinking, crushing, birdcaging, and corrosion.

6. All anti-two-block, two-block warning, and two-block damage prevention systems for proper operation.

b. The operator or other designated person shall examine deficiencies and determine whether they constitute a safety hazard.

15.4.2.3 Monthly Inspection

a. The operator or other designated person shall visually inspect the following items for damage, wear, or other deficiency that might reduce capacity or adversely affect the safety of the crane:

1. Critical items such as brakes and crane hooks.

2. Hoist ropes.

b. Lower the hook block to its lowest position and examine it for any condition that could result in an appreciable loss of strength.

c. Hooks for cracks, deformation, damage from chemicals, latch engagement (if provided), and evidence of heat damage.

d. A hoist rope with any of the conditions noted in the replacement criteria in Section 15.4.2.6 shall be removed from service and replaced.

e. Signed and dated inspection records shall be kept on file and shall be readily available.
f. Before the crane is returned to service, correct deficiencies that could reduce its capacity or adversely effect its safety.

15.4.2.4 Frequent Inspection

a. The operator or other designated person shall visually inspect the crane at daily to monthly intervals (records not required). These inspections shall, in addition to the requirements of Section 15.4.2.2, “Daily Inspection,” include the following:

1. All control mechanisms for maladjustment, excessive wear, or contamination by lubricants or other foreign matter interfering with proper operation.
2. All safety devices for malfunction.
3. Rope reeving for noncompliance with crane manufacturer’s recommendations.
4. Electrical apparatus for malfunctioning, signs of potentially harmful deterioration, and accumulation of dirt or moisture.
5. Tires for recommended inflation pressure.
6. Boom sections for structural integrity.

b. The operator or other designated person shall examine deficiencies and determine whether a more detailed inspection is required.

15.4.2.5 Periodic Inspection

a. Complete inspections of the crane shall be performed by a qualified inspector at 1- to 12-month intervals, depending on its activity, severity of service, and environment.

b. The qualified inspector shall do the following during periodic inspections:

1. Examine deficiencies and determine whether they constitute a hazard.
2. Keep dated and signed inspection records on file and readily available.
3. These inspections, in addition to the requirements of Sections 15.4.2.3, “Monthly Inspection” and 15.4.2.4, “Frequent Inspection,” shall include the following:

15.4.2.5.1 Cranes. Inspect for:

a. Deformed, cracked, or corroded members in the crane structure and the entire boom.

b. Loose bolts or rivets.

c. Cracked or worn sheaves and drums.

d. Hooks damaged from chemicals, deformation, or cracks, or having more than 15 percent in excess of normal throat opening or more than 10 degrees twist from the plane of the unbent hook. (Dye-penetrant, magnetic-particle, or other suitable crack-detecting inspections should be performed at least once a year. See Chapter 13 for additional hook requirements.)

e. Worn, cracked, or distorted parts such as pins, bearings, shafts, gears, rollers, and locking devices.

f. Excessive wear on brake and clutch system parts, linings, paws, and ratchets.

g. Load, boom angle, and other indicators over their full ranges for any significant inaccuracies.

h. Gasoline, diesel, electrical, or other power plants for improper performance or noncompliance with safety requirements.

i. Radiators and oil coolers for leakage, improper performance, or blockage of air passages.

j. Excessive wear of chain drive sprockets and excessive chain stretch.

k. Travel steering, braking, and locking devices, for malfunctioning.

l. Excessively worn or damaged tires.

m. Rust on piston rods and control valves when crane has been idle.

n. Inspect hydraulic and pneumatic hose, fittings, and tubing for:

1. Evidence of leakage at the surface of the flexible hose or its junctions with the metal couplings.

2. Blistering or deformation of the outer covering of the hydraulic or pneumatic hose.
3. Leakage at threaded or clamped joints that cannot be eliminated by normal tightening or recommended procedures.

4. Evidence of excessive abrasion or scrubbing on the outer surface of a hose, rigid tube, or fitting (means shall be taken to eliminate the interface of elements in contact or otherwise protect the components).

15.4.2.5.2 **Hydraulic and Pneumatic Pumps.** Inspect for:

a. Loose bolts or fasteners.
b. Leaks at joints between sections.
c. Shaft seal leaks.
d. Unusual noises or vibration.
e. Loss of operating speed.
f. Excessive heating of the fluid.
g. Loss of pressure.

15.4.2.5.3 **Hydraulic and Pneumatic Valves.** Inspect for:

a. Cracks in valve housing.
b. Improper return of spool to neutral position.
c. Leaks at spools or joints.
d. Sticking spools.
e. Failure of relief valves to attain correct pressure setting (relief valve pressures shall be checked as specified by the manufacturer).

15.4.2.5.4 **Hydraulic and Pneumatic Cylinders.** Inspect for:

a. Drifting caused by fluid leaking across the position.
b. Rod seal leakage.
c. Leaks at welded joints.
d. Scored, nicked, or dented cylinder rods.
e. Dented case (barrel).
f. Loose or deformed rod eyes or connecting joints.

15.4.2.5.5 **Hydraulic Filters.**

Inspect hydraulic filters for evidence of rubber particles on the filter element that may indicate hose, “O” ring, or other rubber-component deterioration. Metal chips or pieces on the filter may denote failure in pumps, motors, or cylinders. Further checking will be necessary to determine the origin of the problem before corrective action can be taken.

15.4.2.5.6 **Wire Ropes.**

a. A qualified inspector shall inspect all wire ropes at least annually. More frequent intervals shall be as determined by a qualified person and shall be based on such factors as expected rope life as determined by severity of environment, percentage of capacity lifts, frequency rates of operation, and exposure to shock loads. The qualified inspector shall carefully note any deterioration, such as described below, that results in appreciable loss of original strength and determine whether further use of the rope constitutes an acceptable risk. This inspection shall include examination of the entire rope length without detaching it from the drum.

1. Reduction of rope size below nominal diameter, whether due to loss of core support, internal or external corrosion, or wear of outside wires (see Table 15-1).

**Table 15-1. Maximum allowable rope reductions.**

<table>
<thead>
<tr>
<th>Rope diameter</th>
<th>Maximum allowable reduction from nominal diameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>Up to 5/16 in. (8 mm)</td>
<td>1/64 in. (0.4 mm)</td>
</tr>
<tr>
<td>Over 5/16 in. to 1/2 in. (13 mm)</td>
<td>1/32 in. (0.8 mm)</td>
</tr>
<tr>
<td>Over 1/2 in. to 3/4 in. (19 mm)</td>
<td>3/64 in. (1.2 mm)</td>
</tr>
<tr>
<td>Over 3/4 in. to 1 1/8 in. (29 mm)</td>
<td>1/16 in. (1.6 mm)</td>

<tr>
<td>Over 1 1/8 in. to 1 1/2 in. (38 mm)</td>
<td>3/32 in. (2.4 mm)</td>
</tr>
</tbody>
</table>

2. A number of broken outside wires and the distribution or concentration of such broken wires.
3. Worn outside wires.

4. Corroded or broken wires at end connections.

5. Corroded, cracked, bent, worn, or improperly applied end connections.

6. Kinking, crushing, cutting, or unstranding.

b. The qualified inspector shall take care when inspecting running rope where rapid deterioration could occur, such as in the following:

1. Sections in contact with saddles, equalizer sheaves, or other sheaves where rope travel is limited.

2. Sections of the rope at or near terminal ends where corroded or broken wires may protrude.

c. The qualified inspector shall take care when inspecting certain ropes such as the following:

1. Rotation-resistant ropes, because of their higher susceptibility to damage. The internal deterioration of rotation-resistant ropes may not be readily observable.

2. Boom hoist ropes, because of the difficulty of inspection and the important nature of these ropes.

d. No precise rules can be given for determining the exact time to replace wire rope because many variables are involved. Safety in this respect depends largely on the use of good judgment by an appointed person in evaluating remaining strength in a used rope, after allowance for deterioration disclosed by inspection. Safety of rope operation depends on this remaining strength.

e. Conditions such as the following shall be sufficient reason for questioning rope safety and considering replacement:

1. In running ropes, six randomly distributed broken wires in one rope lay, or three broken wires in one strand in one rope lay.

2. In standing ropes, more than two broken wires in one lay in sections beyond end connections or more than one broken wire at an end connection.

3. In rotation resistant ropes, two randomly distributed broken wires in six rope diameters or four randomly distributed broken wires in thirty rope diameters.

4. One outer wire broken at the point of contact with the core of the rope that has worked its way out of the rope structure and protrudes or loops out from the rope structure; additional inspection of this section is required.

5. Wear of one-third the original diameter of outside individual wires.

6. Kinking, crushing, birdcaging, or any other damage resulting in distortion of the rope structure.

7. Evidence of heat damage from any cause.

8. Reduction from nominal diameter greater than those listed in Table 15-1.

f. All rope that has been idle for a month or more due to shutdown or storage of a crane on which it is installed shall be inspected before it is placed in service. This inspection shall be for all types of deterioration and shall be performed by an appointed person whose approval shall be required before further use of the rope. A written and dated report of the rope condition shall be filed.

g. To establish data as a basis for judging the proper time for replacement, maintain a continuing inspection record covering the points of deterioration listed above.

h. Ensure that replacement rope is the same size, grade, and construction as recommended by the crane manufacturer, unless otherwise recommended by a rope or crane manufacturer due to actual working condition requirements.

i. Never use discarded rope for slings.

15.4.2.5.7 Load Hooks/Load Blocks.

Load hooks/load blocks that have been changed-out shall be inspected by a qualified inspector before the crane is returned to service. Inspection records shall be retained throughout the service life of the hook or load block and shall be readily available.
15.4.2.6 Cranes Not in Regular Use

a. A crane that has been idle for 1 month or longer but less than 6 months shall be given an inspection according to requirements of Section 15.4.2.4, “Frequent Inspection,” before it is placed in service.

b. A crane that has been idle for more than 6 months shall be given a complete inspection according to the requirements of Section 15.4.2.5, “Periodic Inspection,” before it is placed in service.

c. Standby cranes shall be inspected at least semiannually, according to the requirements of Section 15.4.2.5. Cranes exposed to adverse environments should be inspected more frequently.

15.4.3 Mobile Cranes/Boom Trucks—Testing

a. Prior to their initial use, all cranes in which load-sustaining parts have been modified, replaced, or repaired shall be load-tested by a qualified inspector or under the direction of that inspector. The replacement of rope is excluded from this requirement. However, a functional test of the crane under a normal operating load should be made before the crane is put back in service.

b. Test weights shall not exceed 110 percent of the rated capacity and shall be accurate to within -5 percent, +0 percent of stipulated values.

c. The inspector shall furnish a written report showing test procedures and confirming the adequacy of repairs or alterations. Test reports shall be kept on file and shall be readily available to appointed personnel.

d. The following shall also be tested as applicable during initial testing:

1. Load lifting and lowering mechanisms.
2. Boom lifting and lowering mechanisms.
3. Boom extension and retraction mechanism.
4. Swinging mechanism.
5. Travel mechanism.

Load tests shall not be conducted in locations where the lift meets the definition of critical lift given in Section 15.2, “Definitions.”

15.4.4 Forklift Trucks—Inspection

a. Prior to initial use, all new, modified, or repaired forklifts shall be inspected by a qualified inspector to ensure compliance with the provisions of this section.

b. A scheduled planned inspection, maintenance, and lubrication program shall be followed; consult the manufacturer’s recommendations.

c. Only trained and authorized personnel shall be permitted to inspect, maintain, repair, and adjust forklift trucks; these services shall be performed in accordance with manufacturer’s specifications. Items listed in the following paragraphs shall be regularly inspected.

1. Inspect brakes, steering mechanisms, control mechanisms, warning devices, lights, governors, lift-overload devices, guards, and safety devices regularly and maintain them in a safe-operating condition.

2. Carefully and regularly inspect all parts of lift and tilt mechanisms and frame members and maintain them in a safe-operating condition.

3. For special trucks or devices that are designed and approved for operation in hazardous areas, ensure that the original, approved safe-operating features are preserved by maintenance.

4. Check fuel systems for leaks and for the condition of the parts. Give special consideration in case of a leak in the fuel system. Take action to prevent use of the truck until the leak has been corrected.

5. Inspect all hydraulic systems and maintain them in conformance with good practice. Check tilt cylinders, valves, and other similar parts to ensure that drift or leakage has not developed to the extent that it would create a hazard.

6. Maintain instruction plates, tags, or decals for capacity, operation, and maintenance
in legible condition.

7. Inspect batteries, motors, controllers, limit switches, protective devices, electrical conductors, and connections and maintain them in conformance with good practice. Pay special attention to the condition of electrical insulation.

8. Attachments shall be included in a scheduled maintenance/inspection program. Inspection steps shall be tailored for the attachment. Load-bearing components shall be examined for deformation and load-bearing welds shall be visually examined for cracks. Mechanical or hydraulic components shall be inspected and maintained in accordance with the manufacturer’s instructions.

9. Attachments shall be inspected not less than annually and the inspection should be documented.

10. Fork inspection shall be carried out by a qualified inspector with the aim of detecting any damage, failure, deformation, or other condition that might impair safe use. A fork that shows any of the following defects shall be withdrawn from service, and shall not be returned to service until it is satisfactorily repaired by the fork manufacturer or an expert of equal competence. Fork inspection shall include:

   i. **Surface Cracks** - A thorough visual examination for cracks and, if considered necessary, non-destructive crack detection, with special attention to the heel and to the welds that attach the mounting components to the fork blank. Inspection for cracks shall include any mounting mechanisms of the fork blank to the fork carrier. Forks shall not be returned to service if surface cracks are detected.

   ii. **Fork Tine Inspection** - Examination for straightness of blade and shank, fork angle (upper face of blade to load face of the shank), fork blade and shank wear. Difference in height of fork tips may vary from manufacturer to manufacturer and with tine length. For these reasons, fork tine inspections shall be done in accordance with manufacturers requirements.

   iii. **Positioning Lock** - Confirm that the Positioning Lock (when provided), is in good repair and in correct working order. If any fault is found, the fork shall be withdrawn from service until satisfactory repairs are made.

   iv. **Fork Hooks Wear** - When fork hooks are provided, the support face of the top hook and the retaining faces of both hooks shall be checked for wear, crushing, and other local deformations.

   v. **Fork Marking** - When fork marking is not clearly legible, it shall be renewed. Marking shall be renewed per instructions from the original fork supplier.

### 15.4.5 Forklift Trucks—Testing

Forklift truck load tests are not routinely required.

a. Load tests shall not be conducted until verification that inspection and maintenance is up to date.

b. Load tests shall be performed after major repair or modification to components that affect the load-carrying ability of the truck.

c. The manufacturer should be consulted if questions arise as to whether a load test is appropriate.

d. Forklift trucks shall be load tested by or under the direction of a qualified person and in accordance with the manufacturer’s recommendations.

e. Test weights shall be accurate to within -5 percent, +0 percent of stipulated values.

f. Load-test records shall be maintained and shall be made available for examination by the construction management contractor.

g. A load test shall not be conducted in locations such that the lift meets the definition of critical lift in Section 15.2.

h. A fork that has undergone repair, other than repair or replacement of positioning locks or marking, shall be subject to a load test as described in ASME B56.1, Section 7.25, "Forks," Item 3, which lists loading and method
of test for forks; except for the test load, which shall correspond to 2.5 times the rated capacity marked on the fork.

i. Load capacity of an attachment shall be verified by the manufacturer or by a load test at 100% capacity that is performed onsite. Load tests are not routinely required since a catalog cut, user’s manual, decals on attachment, or other manufacturer’s data serves as capacity verification.

15.4.6 Slings—Inspection

15.4.6.1 Wire Rope

a. Users or other designated personnel shall visually inspect all wire-rope slings each day prior to use, carefully noting any deterioration that could result in an appreciable loss of original strength and determining whether further use of the sling would constitute a safety hazard.

b. Slings shall be immediately removed from service if any of the following conditions are present:

1. Ten randomly distributed broken wires in one rope lay, or five broken wires in one strand in one rope lay.
2. Wear or scraping of one-third the original diameter of outside individual wires.
3. Kinking, crushing, birdcaging, or any other damage resulting in distortion of the rope structure.
4. Evidence of heat damage from any cause.
5. End attachments that are cracked, deformed, or worn.
6. Hooks that have been opened more than 15 percent of the normal throat opening measured at the narrowest point or twisted more than 10 degrees from the plane of the unbent hook.
7. Corrosion of the rope or end attachments.

15.4.6.2 Synthetic Web Slings

a. Users or other designated personnel shall visually inspect all synthetic-web slings each day prior to use, carefully noting any deterioration that could result in an appreciable loss of original strength and determining whether further use of the sling would constitute a safety hazard.

CAUTION: Tiedown and/or ratchet straps shall not be used as synthetic-web slings. Only synthetic-web slings constructed from webbing approved for sling construction by the manufacturer or other qualified person shall be used at DOE locations.

b. A synthetic-web sling shall be removed from service if any of the following defects are visible:

1. Acid or caustic burns.
2. Melting or charring of any part of the surface.
3. Snags, punctures, tears, or cuts.
4. Broken or worn stitches.
5. Wear or elongation exceeding the amount recommended by manufacturers.
6. Distortion of fittings.

15.4.6.3 Alloy Steel Chain

a. Users or other designated personnel shall visually inspect all steel-chain slings each day before they are used as follows:

1. Conduct a link-by-link inspection for the following defects: bent or stretched links, cracks in any section of link, scores, or abrasions tending to weaken the rings or hooks. Reject if discovered.
2. Check rings and hooks for distortion, cracks in weld areas, corrosion, scores, or abrasions tending to weaken the ring or hooks. Reject if discovered.
3. Perform inspection on an individual-link basis. If any link does not hinge freely with the adjoining link, remove the assembly from service.
b. Remove from service assemblies with deformed master links or coupling links.

c. Remove from service assemblies if hooks have been opened more than 15 percent of the normal throat opening measured at the narrowest point or twisted more than 10 degrees from the plane of the unbent hook.

d. Do not straighten deformed hooks or other attachments on the job. Assemblies with such defects shall be reconditioned by the manufacturer.

e. Remove from service assemblies with cracked hooks or other end attachments; assemblies with repairable defects shall be reconditioned or repaired prior to being returned to service.

f. If wear exceeds the values shown in Table 15-2, remove the assembly from service.

NOTE: For other sizes, consult chain or sling manufacturer.

15.4.7 Slings—Testing

15.4.7.1 Wire Rope

a. All swaged and poured socket sling assemblies shall be certified as having been proof-tested. All other sling assemblies shall be proof-tested when specified by the purchaser.

b. As a minimum, the proof load shall be equal to the rated capacity but shall not exceed:

1. 125 percent of the vertical rated capacity for single-leg, hand-tucked slings.

2. 200 percent of the vertical rated capacity for mechanical-splice single-leg slings and endless slings.

c. The proof load for multiple-leg bridle slings shall be applied to the individual legs and shall be either 200 percent for mechanical-spliced or 125 percent for hand-tucked splice times the vertical rated capacity of a single-leg sling. Master links to which multiple-leg slings are connected shall be proof-loaded to 200 percent times the force applied by the combined legs.

d. Welded end attachments shall not be used unless proof-tested at 2 times the rated capacity prior to initial use.

e. Test loads described above shall be accurate to within -5 percent, +0 percent of stipulated values. A written letter of certification by the manufacturer or a pull test witnessed and certified in writing by a qualified person is acceptable.

15.4.7.2 Synthetic Web Slings

a. When specified by the purchaser, web slings of all types shall be certified as having been proof-tested prior to initial use.

1. The proof load for single-leg slings and endless slings shall be 200 percent of the vertical rated capacity.

2. The proof load for multiple-leg bridle slings shall be applied to the individual legs and shall be 200 percent of the vertical rated capacity of a single-leg sling. Master links to which multiple-leg slings are connected shall be proof-loaded to 200 percent times the force applied by the combined legs.

b. Test loads shall be accurate to within -5 percent, +0 percent of stipulated values. Either certification by the manufacturer or a pull test certified by a qualified person is acceptable.

15.4.7.3 Alloy Steel Chain

a. Single-leg and endless alloy-steel chain slings shall be certified as having been proof-tested to 200 percent of the rated capacity prior to initial use.

b. The proof load for multiple-leg bridle slings shall be applied to the individual legs and shall be 200 percent of the vertical rated capacity of a single-leg sling. Master links to which multiple-leg slings are connected shall be proof-loaded to 200 percent multiplied by the
force applied by the combined legs.

c. Test loads shall be accurate to within -5 percent, +0 percent of stipulated values. Either certification by the manufacturer or a pull test certified by a qualified person is acceptable.

15.4.8 Rigging Accessories—Inspection

a. Users or other designated personnel shall inspect shackles, rings, eyebolts, lifting bars, rigging assemblies, and hooks at the beginning of each shift in which they are to be used, as follows:

1. Inspect shackles, rings, and similar items for wear, corrosion, spreading, and deformation. Replace them if deformation exceeds 15 percent of their new condition. Replace shackle pins if they show any sign of failure in shear.

2. Inspect lifting bars and spreaders for signs of failure in bending; replace if permanently bent more than ½ in. in 10 ft or if twisted more than 5 degrees out of the original plane. Examine hook-attachment welds for cracks and signs of failure in tension.

3. Hooks having any of the following deficiencies shall be removed from service until repaired or replaced:
   
   i. Cracks.
   
   ii. Wear exceeding 10 percent of the original dimension.

   iii. A bend or twist exceeding 10 degrees from the plane of the unbent hook.

   iv. Increase in throat opening exceeding 15 percent from the new condition.

4. If a latch is provided and it becomes inoperative because of wear or deformation or fails to fully bridge the throat opening, remove the hook from service until the latch has been repaired or replaced.

NOTE: If hooks are painted, a visual inspection should take the coating into consideration. Surface variations can disclose evidence of heavy or severe service. In such instances, the surface condition may call for stripping the paint.

15.4.9 Rigging Accessories—Testing

a. Tackle assemblies, handling fixtures, and rigging accessories for critical-lift service shall have an initial proof-load test of 2 times the rated capacity. The tackle shall be proof-tested prior to making a critical lift if proof-testing cannot be verified.

b. Tackle assemblies, handling fixtures, and rigging accessories that have been modified or repaired shall be proof-tested again to 2 times the rated capacity prior to making a critical lift.

c. Test loads shall be accurate to within -5 percent, +0 percent of stipulated values.
15.5 OPERATION

The following shall apply to all personnel involved in construction hoisting and rigging operations.

a. An appointed person shall classify each lift into one of the DOE categories (ordinary or critical), prior to planning the lift.

b. A lift shall be designated as a critical lift if collision, upset, or dropping could result in any one of the following:
   1. Damage that would result in unacceptable delay to schedule or other significant program impact such as loss of vital data.
   2. Significant release of radioactive or other hazardous material or other undesirable conditions.
   3. Unacceptable risk of personnel injury or significant adverse health impact (onsite or offsite).
   4. Undetectable damage that would jeopardize future operations or the safety of a facility.

c. A lift should also be designated as critical if the load requires exceptional care in handling because of size, weight, close-tolerance installation, high susceptibility to damage, or other unusual factors.

15.5.1 Conduct of Operator

a. Ensure proper functioning of tires, horns, lights, batteries, controllers, lift systems (including load-engaging means, limit switches, etc.), brakes, and steering mechanisms. If at any time a lifting device is found to be defective or in any way unsafe, report it immediately to appropriate management and take the unit out of service until it has been restored to safe-operating condition or a determination has been made by the construction management contractor that the deficiency will not adversely affect the operation of the unit.

b. The safety of personnel and equipment is the first priority. Report or correct any unsafe condition immediately.

c. If the operator's visibility is impaired by dust, darkness, snow, fog, or rain, strict supervision of the operation must be exercised, and if necessary, the equipment shall be withdrawn from service.

d. Be alert while operating and always keep your eye on the load. If your attention must be directed elsewhere, discontinue operation first. Keep a signaler in full view if you cannot see the load at all times.

e. Never operate the machine or allow anyone to operate it unless that person is thoroughly familiar with the machine, its operation, and proper care.

f. Be a good housekeeper. Keep the work area free of oil, grease, rags, buckets, barrels, and other hazards. Keep loose parts in a tool box. Use only nonflammable solutions for cleaning. Be sure shoe soles are clean and dry before operating brakes.

g. Replace all missing or broken guards and panels.

h. Never tamper with safety devices.

i. Have a fire extinguisher on hand and know how to use it. Be sure that it is checked regularly (at least monthly) to ensure it is in proper working order.

j. Check the motion controls for proper functioning at the start of each shift or prior to use if the crane has not been in regular service.

k. Make certain that no one is working on or close to the machine before starting the engine or beginning to move. Accessible areas within the swing radius of the rear of the rotating superstructure of the crane, either permanently or temporarily mounted, shall be barricaded in such a manner as to prevent an employee from being struck or crushed by the crane.

l. Use caution when refueling. Stop the engine; do not permit smoking within 25 ft; never refuel near an open flame. Keep metal funnels in contact with the filler tube to prevent static spark. Turn off the heater before fueling.

m. Use both hands to mount and dismount. Never get on or off a moving machine, and never jump off, even if the machine is stationary.

n. Hand signals from only one person shall be obeyed. However, obey a STOP signal.
regardless of who gives it. Use the standard signals shown in Figure 15-12.

o. Many machines have ratings limited by factors other than machine stability. Never exceed the rated capacity.

p. Make a dry run in confined areas to help determine the safest way to operate under existing conditions.

q. Check loads before moving them. First, determine the load weight and check it against the capacity chart. Be sure the load is well secured and the hoist ropes are not kinked. Ensure that the hoist ropes are vertical and avoid sudden starts and stops.

15.5.2 Mobile Cranes/Boom Trucks

a. Never use signs of tipping to determine if a load is within a crane's capacity. Operating by the “seat of the pants” is an unacceptable practice.

b. Know the rated capacity of the crane. A safe lift depends on boom length, boom angle, and working radius. Follow these suggestions to avoid structural failure or tipping:

1. Know the radius of the load. Remember that the radius is measured from center of rotation, not from the boom foot pins.

2. Always operate within the rated capacity of the machine.

3. Subtract the weight of hooks, blocks, and any other material-handling devices (slings, shackles, spreader bars, etc.) from the gross capacity of the crane to determine if the load can be lifted safely.

4. Load chart ratings are based on operating the machine on firm, level ground. Outriggers shall be fully extended and lowered so that all wheels are clear of the ground, unless otherwise specified on the manufacturer load charts for the crane. Otherwise, “on rubber” load charts shall be used.

5. Avoid rapid changes in velocity while hoisting, swinging, or lowering the load; these can cause overloads when operating at or near the crane’s capacity.

6. Do not lift large, heavy loads in strong winds. Wind loading can be critical depending on boom length, boom angle, bulkiness of the load, wind direction, and wind velocity.

7. In the absence of crane manufacturer's instructions regarding maximum wind speeds for operation, operations undertaken at wind speed in excess of 25 mph should be evaluated by a qualified person to determine if the size, shape and weight of the load can be safely lifted.

c. Always use the shortest boom possible, and observe these precautions with any boom length:

1. Make only vertical lifts. Never pull the load sideways.

2. Keep speed slow in lifting, lowering, and stopping loads.

3. Do not let the load strike the boom or outriggers and never allow a crane boom to hit or touch any structure. (Boom contact could dent or bend the lower boom chords and may cause a total boom collapse.) Boom contact with any object shall require an engineering evaluation prior to putting the crane back in service. Damage to the crane sustained during operation shall be repaired according to manufacturer’s specifications using certified welders. A reinspection or load test is required after repairs are complete, as is a recertification by the construction management contractor at the subcontractor's expense indicating that the unit can return to service.

4. Allow maximum clearance between the hook block and boom point sheaves.

5. Keep near-capacity loads as close to the ground as possible.

d. Cranes shall not be operated without the ballast or counterweight being in place as specified by the crane manufacturer. Under specific conditions, such as during crane assembly, unusual boom configurations, etc. the crane manufacturer’s recommendations for the amount of ballast or counterweight shall be adhered to. Ballast or counterweight as specified by the manufacturer shall not be exceeded.

e. Rotate the crane slowly to avoid an outward swing of the load. Attach a tag line to the load to control the swing.

f. Keep the boom high enough to swing clear of the cab when rotating the crane on
HOIST. With forearm vertical, forefinger pointing up, move hand in small horizontal circles.

LOWER. With arm extended downward, forefinger pointing down, move hand in small horizontal circles.

USE MAIN HOIST. Tap fist on head, then use regular signals.

USE WHIPLINE (Auxiliary Hoist). Tap elbow with one hand, then use regular signals.

RAISE BOOM. Extend arm, fingers closed, thumb pointing upward.

LOWER BOOM. Extend arm, fingers closed, thumb pointing downward.

MOVE SLOWLY. Use one hand to give any motion signal and place other hand motionless above hand giving the motion signal. (Hoist slowly shown as example.)

RAISE THE BOOM AND LOWER THE LOAD. With arm extended, thumb pointing up, flex fingers in and out as long as load movement is desired.

LOWER THE BOOM AND RAISE THE LOAD. With arm extended, thumb pointing down, flex fingers in and out as long as load movement is desired.

Figure 15-12. Standard hand signals for controlling crane operation.
Figure 15-12. (continued).
15.5.2.1 Attaching the Load

a. Ensure that the hoist rope is free of kinks or twists and is not wrapped around the load.

b. Attach the load to the load-block hook with slings or other approved devices.

c. Make certain that the sling clears all obstacles.

15.5.2.2 Moving the Load

a. Before moving the load, make certain that it is well secured and properly balanced in the sling or lifting device before lifting it more than a few inches.

b. Before starting to hoist, note the following conditions:

1. Multiple-part lines shall not be twisted around each other.

2. The hook shall be positioned over the load in such a manner as to prevent swinging when the load is lifted.

3. If there is a slack-rope condition, determine that the rope is properly seated on the drum and in the sheaves.

c. Test stability before lifting heavy loads. Check outrigger footing. Lift load slightly off the ground and stop. Check the machine for movement and check to be sure the brakes are holding. Never use machine stability to determine capacity. If there are any indications of tipping, the machine is already overloaded for that working radius.

d. Do not use cranes for side pulls except when specifically authorized by a designated person who has determined that the stability of the crane is not endangered and that the parts of the crane will not be over stressed.

e. Do not hoist, lower, or travel while anyone is on the load or hook, except as noted in Section 15.5.2.6, “Lifting Personnel.”

f. Do not move loads above people.

g. Test the brakes each time a load

Figure 15-12. (continued).
approaching the rated capacity is handled by raising the load a few inches and applying the brakes.

h. Power down when lowering loads. When lowering heavy loads, keep the hoist brakes as reserve. Use a safety pawl on the boom-hoist drum when not lowering.

i. Do not lower the load below the point where less than two full wraps of rope remain on the hoist drum.

j. Do not leave your position at the controls while the load is suspended unless required to do so by an approved emergency procedure.

k. Work on suspended loads is prohibited under normal conditions. When the responsible manager decides that is necessary to work on suspended load, guidelines for ensuring safety of the work shall be established through consultation with the appropriate safety organization. Suspended loads that must be worked on shall be secured against unwanted movement.

l. Tag lines should be used as required to guide, snub or otherwise control the load.

15.5.2.3 Traveling the Machine

a. Secure the boom and hook block.

b. Check bridges before crossing; make sure they will support the weight of the machine.

c. Check river depths before fording.

d. Check clearances under overpasses, overhead lines, or any overhead obstruction. When side clearances are tight, post a lookout and be sure there is clearance for tail swing.

e. When traveling with a load, snub the load to prevent swaying if possible. Never travel with near-capacity loads.

f. Never travel a rubber-tired unit with a load over the side.

g. On soft surfaces, always move with the load behind; this helps to raise the leading end of the tracks and makes traveling safer.

h. Always set swing brakes when the unit is idle or holding loads for a period of time, especially on slopes. If swinging during travel is necessary, engage the swing-jaw clutch before releasing brakes.

i. Never back up until everyone is clear of the machine, and use a signaler when backup alarms are not provided.

j. Avoid tipping by never backing the crane while carrying a maximum load.

k. For long moves, position the boom in the direction of travel.

l. Block treads when moving uphill to prevent downhill movement before shifting steering clutches.

m. Lock the turntable prior to highway travel. Use a house lock or swing brake, and lower boom into the rack to prevent swing.

n. When loading machine on the trailer, always use a ramp; if a ramp is not available, use blocking to build one.

o. Be familiar with the equipment and its proper care. If adjustments or repairs are necessary, promptly report this to the appropriate level of management.

p. Test all controls at the start of a new shift. If any controls fail to operate properly, adjust or repair them before operations are begun.

q. Block under the boom before disassembling. Never stand on or under the boom during this work.

r. Before disconnecting oil lines, if machine has hydraulic controls, be sure to place the boom on the ground or in the boom rest, then move the pedals and control levers to equalize pressures within the cylinders. Always release any air supercharge on the hydraulic reservoir and shut off the engine (or declutch pumps) before disconnecting oil lines.

s. Do not reach into hydraulic-boom holes unless the sections are securely anchored together.

15.5.2.4 Operating Near Power Lines and Transmission Towers

It is recognized that operating mobile cranes where they can become electrified from electric power lines is an extremely hazardous practice. It is advisable to perform the work so there is no possibility of the crane, load line, or load becoming a conductive path, (Figure 15-13). The following steps shall be taken to minimize the hazard of electrocution or serious injury as a result of contact between the energized power lines and the crane, load line, or load:
a. The (electric) Power Marketing Administrations in DOE may deviate from the requirements of Table 15-3, providing the work is done according to line management-approved procedures that do not conflict with statutory regulations or approved variances from these regulations.

b. Any overhead wire shall be considered to be an energized line unless and until the person owning the line or the electrical utility authorities indicate that it is not an energized line.

c. Durable signs shall be installed at the operator’s station and on the outside of the crane, warning that electrocution or serious bodily injury may occur unless a minimum clearance of 10 ft (3.1 m) is maintained between the crane or the load being handled and energized power lines. Greater clearances are required because of higher voltage as stated in Table 15-3. These signs shall be revised but not removed when a local jurisdiction requires greater clearances.

d. Exercise caution when working near overhead lines having long spans as they tend to move laterally or vertically due to the wind, which could cause them to breach the safety zone.

e. Cranes shall not be used to handle materials stored under electric power lines unless any combination of the boom, load, load line, or machine component cannot enter the prohibited zone.

f. Crane operators shall not rely on the coverings of wires for their protection.

**15.5.2.4.1 Crane Operation Near De-energized and Grounded Electric Power Lines**

This is the preferred condition under which the operation can be performed safely. The hazard of injury or death due to electrocution has been remove. The following steps shall be taken to assure de-energization of the power lines has occurred:

a. The power company or owner of the power lines shall de-energize the lines.

b. The lines shall be visibly grounded to avoid electrical feedback and appropriately marked at the job-site location.

c. A qualified representative of the owner of the lines or a designated representative of the electrical utility shall be on site to verify that steps (a) and (b) have been completed and that the lines are not energized.

**15.5.2.4.2 Power Lines Energized, Crane Operating Less than Erected/Fully Extended Boom Length away from the Prohibited Zone (see Figure 15-14)**

a. An on-site meeting between project management and a qualified representative of the owner of the lines or a designated representative of the electrical utility shall take place to establish the procedures to safely complete the operations.

b. The specified clearance between the power lines and the crane, load line, and load shall be maintained at all times as specified in Table 15-3.

c. Load control, when required, shall utilize tag lines of a non-conductive type.

d. Operation of boom and load over electric power lines is extremely dangerous, due to...

e. A designated signaler, whose sole responsibility is to verify that the required clearance is maintained shall be in constant contact with the crane operator.

f. No one shall be permitted to touch the crane or the load unless the designated to perception of distance and multiple contact points as viewed from the position of the operator and/or position of the designated signaler. The operator should avoid operating the crane, with or without a load, in this area.

g. The horizontal and vertical distance of movement of long span lines due to the wind shall be added to the minimum clearance distance as specified in Table 15-3. A qualified representative of the owner of the lines or a designated representative of the electrical utility shall be consulted for specific distances.

h. Devices such as ribbons, balls, etc., should be attached by a qualified person to the power lines to improve visibility, or equivalent means employed to aid in location of the prohibited zone.

Figure 15-14. Danger zone for cranes and lifted loads operating near electrical transmission line.
15.5.2.4.3 Crane Operations are Within the Prohibited Zone and the Power Lines are Energized

a. Before such operations take place, a qualified person together with a qualified representative of the utility or an engineer qualified in power line transmission shall, after visiting the site, determine if this is the most feasible way to complete the operation, and set minimum required clearances and procedures for safe operations. These operations shall be under their supervision.

The following guidelines should be required:

1. Crane/load grounded to a neutral line by the utility.
2. Electrical system protective devices that automatically re-energize the circuit after a power line contact occurrence should be blocked or disengaged to inhibit this function.
3. Insulated barriers, which are not a part of nor an attachment to the crane and which will not allow contact between the energized electric power lines and the crane, load lines, or load.
4. Non-conductive barricades to restrict access to the crane work area.

b. Load control, when required, shall utilize tag lines of a non-conductive type.

c. A designated signaler, whose sole responsibility is to verify that the clearances established are maintained, shall be in constant contact with the crane operator.

d. The person responsible for the operation shall alert and warn the crane operator and all persons working around or near the crane about hazard of electrocution or serious injury and instruct them on how to avoid the hazard.

e. All non-essential personnel shall be removed from the crane work area.

f. No one shall be permitted to touch the crane or the load unless the signaler indicates it is safe to do so.

15.5.2.4.4 Crane in Transit With No Load and Boom Lowered (see Figure 15-15)

a. Cranes in transit with no load and boom lowered shall maintain clearance as specified in Table 15-3.

b. A designated signaler shall be assigned to observe the clearance and give warning before the crane approaches the above limits.

c. When planning transit of the crane, the effect of speed and terrain on the boom and crane movement shall be considered.

15.5.2.4.5 Crane Operation Near Transmitter Towers (see Figure 15-16)

a. Prior to work near transmitter towers where an electrical charge can be induced in the equipment or materials being handled, the transmitter shall be deenergized or tests shall be made to determine if electrical charge is induced on the crane. The following precautions shall be taken when necessary to dissipate induced voltages:

1. The equipment shall be provided with an electrical ground directly to the upper rotating structure supporting the boom.

2. Ground jumper cables shall be attached to materials being handled by boom equipment when electrical charge is induced while working near energized transmitters; crews shall be provided with nonconductive poles having large alligator clips or other similar protection to attach the ground cable to the load.

3. Combustible and flammable materials shall be removed from the immediate area prior to operations.

15.5.2.5 Ordinary Lifts

a. An appointed person shall classify each lift into one of the DOE categories (ordinary or critical) prior to planning the lift.

b. Hoisting and rigging operations for ordinary lifts require a designated leader who shall be present at the lift site during the entire lifting operation. If the lift is being made by only one person, that person assumes all responsibilities of the designated leader.

c. Leadership designation may be by written instructions, specific verbal instructions for the particular job, or clearly defined responsibilities within the crew's organizational structure.

d. The designated leader's responsibility shall include the following:
Figure 15-15. Danger zone for cranes and lifted loads operating near electrical transmission line. (See Table 15-3 for minimum radial distance of prohibited zone.)
Figure 15-16. Danger zone for cranes and lifted loads operating near electrical transmission line.
1. Ensure that personnel involved understand how the lift is to be made.

2. Ensure that the weight of the load is determined, that proper equipment and accessories are selected, and that rated capacity is not exceeded.

3. Survey the lift site for hazardous/unsafe conditions.

4. Ensure that equipment is properly set up and positioned.

5. Ensure that a signaler is assigned, if required, and is identified to the operator.

6. Direct the lifting operation to ensure that the lift is completed safely and efficiently.

7. Stop the job when any potentially unsafe condition is recognized.

8. Direct operations if an accident or injury occurs.

   a. The designated leader shall inspect all cranes to ensure that they are still within the inspection interval.

   f. The designated leader shall inspect all lifting devices to ensure that the rated capacity of these items of equipment will not be exceeded.

15.5.2.6 Critical Lifts

   a. The operating organization shall appoint a person-in-charge (PIC) of the lifting operation. This person shall meet the definitions of appointed, designated, and qualified, as described in Section 15.2, “Definitions.”

   b. The PIC shall ensure that a pre-job plan is prepared that defines the operation and shall include the following:

      1. Identification of the items to be moved, the weight, dimensions, center of gravity, and the presence of hazardous or toxic materials.

      2. Identification of cranes to be used by type and rated capacity.

      3. Rigging sketches that include (as applicable):

         i. Identification and rated capacity of slings, lifting bars, rigging accessories, and below-the-hook lifting devices.

         ii. Load-indicating devices.

         iii. Load vectors.

         iv. Lifting points.

         v. Sling angles.

         vi. Boom and swing angles.

         vii. Methods of attachment.

         viii. Crane orientations.

         ix. Other factors affecting equipment capacity.

   4. Operating procedures and special instructions to operators including rigging precautions and safety measures to be followed as applicable.

   c. Experienced operators who have been trained and qualified to operate the specific equipment to be used shall be assigned to make the lift.

   d. Only designated, qualified signalers shall give signals to the operator. *However, obey a STOP signal at all times no matter who gives the signal.*

   e. The responsible manager or designee shall review and approve the procedure and rigging sketches before the lift is made.

   f. A pre-lift meeting involving participating personnel shall be conducted prior to making a critical lift. The critical lift plan/procedure shall be reviewed and questions shall be resolved.

   g. If required by the critical lift procedure, a practice lift shall be done before the critical lift. Conditions for a practice lift should closely simulate actual conditions involving: weight, rigging selection and configuration, load movement path, and other relevant factors. Practice lifts should be done by the same crew, using the same lifting equipment.
15.5.2.7 Lifting Personnel

a. Do not lift, lower, swing, or travel the crane or forklift while a worker is on the hook, load, personnel platform, boom, or personnel-lifting device attached to the crane hoist rope, boom, or tines except as described in the paragraphs below.

b. The person specifically responsible for the overall work function to be performed shall determine that there is no practical alternative machine or equipment to perform the work, such as a ladder, scaffold, stairway, aerial lift, or personnel hoist. If a determination is made that lifting by crane or forklift is required, the construction management contractor shall be notified and will approve the requirement before the lift is made.

c. Use only personnel platforms that are specifically designed and constructed for the purpose of suspending personnel according to the following:

1. The personnel platform shall be designed by a qualified person competent in structural design, and all welding of the platform shall be performed by a qualified welder familiar with the weld grades, types, and material specified in the design.

2. The platform shall be limited to carrying six persons.

3. The personnel platform and rigging shall be capable of supporting, without failure, at least five time the maximum intended load.

4. The platform shall bear a plate specifying its empty weight and the maximum number of persons and weight for which it is rated.

5. The platform shall have perimeter protection consisting of a top rail approximately 45 in. (115 cm) high, a toeboard at least 4 in. (10 cm) high, and a midrail approximately half-way between the top rail and the toeboard.

6. A grab rail shall be provided inside the personnel platform to minimize hand exposure.

7. The sides of the platform shall be enclosed from the toeboard to the midrail with solid construction or expanded metal having openings no greater than ½ in. (1.27 cm).

8. If access doors are installed, they shall open only to the interior of the platform. Access doors shall be equipped with a device to restrain them from opening unintentionally.

9. The personnel platform shall have overhead protection when there is an overhead hazard.

10. Sufficient headroom shall be provided to allow employees to stand upright in the platform.

11. Rough edges exposed to contact by employees shall be surfaced (ground smooth) to prevent injury.

12. The platform shall be easily identifiable by high-visibility color or marking.

13. All welding procedures and welding operator qualifications shall be in accordance with ANSI/AWS D1.1 when welding is to be performed on load-sustaining members. Where special steels or other materials are used, the manufacturer shall provide welding procedures. Welds shall be inspected by a qualified inspector.

14. When being supported by a crane, the platform shall be attached to the hoist rope by a hook of a type that can be closed and locked, eliminating the hook throat opening. Alternatively, an alloy steel anchor shackle with a bolt, nut, and retaining pin may be used.

15. All eyes in wire-rope slings shall be fabricated with thimbles, and rigging accessories for attaching the personnel platform to hoist lines shall not be used for any other purpose when not hoisting personnel.

16. The suspension system shall minimize inclination of the personnel platform due to the movement of personnel on the personnel platform.

d. At each new job site (and at least annually) prior to hoisting personnel, the personnel platform, rigging, and hook block shall be proof-tested by a qualified inspector to twice the personnel platform's rated capacity by holding it suspended for 5 min with the test load suitably distributed on the personnel platform. After proof-testing, any deficiencies revealed by inspection, or by the proof test, shall be corrected, and another proof test conducted. Any modification to the personnel platform or rigging shall require retesting.
e. Prior to the trial lift, a meeting shall be held with the designated leader, qualified operator, signaler, persons to be lifted, and the person responsible for overall worksite safety to plan and review procedures to be followed. Procedures for entering and leaving the personnel platform or other device and the points at which persons will enter and leave the device shall be reviewed.

f. Prior to lifting personnel and after the proof test, the qualified operator and signaler shall conduct a trial lift with the personnel platform loaded to at least the anticipated load.

g. The trial lift shall be made from ground level (or any other location where employees will enter the platform) to each location at which the platform is to be hoisted and positioned. The designated leader and the operator shall determine that:

1. Crane (mobile) footing is adequate.
2. System controls and safety devices are activated and functioning properly.
3. No interferences exist.
4. Configuration necessary to reach work locations will allow the crane to remain under 50 percent of rated capacity.

NOTE: Materials and tools to be used during the actual lift, if secured to prevent displacement, can be in the platform for the test lift.

NOTE: A single trial lift may be performed for all locations to be reached from a single setup position.

h. The trial lift shall be repeated prior to hoisting employees whenever:

1. The crane (mobile) travels or is moved and set up in a new location or returned to a previously used location.
2. The lift route is changed, unless the operator determines that the safety of the hoisted personnel is not affected.

i. A visual inspection of the crane, rigging, and personnel platform shall be conducted by a qualified inspector immediately after the trial lift, prior to lifting personnel. Any defects found that create a safety hazard shall be corrected prior to hoisting personnel.

j. After the trial lift and just before hoisting personnel, the platform shall be lifted a few inches and inspected to ensure that it is secure and properly balanced. Personnel shall not be hoisted unless the following conditions exist:

1. Hoist ropes are free of kinks.
2. Multiple-part lines are not twisted around each other.
3. The primary attachment is centered over the platform.
4. Ropes are properly seated on drums and sheaves.

k. These special procedures shall be followed when lifting personnel:

1. The crane shall be inspected daily prior to lifting personnel, in accordance with the requirements for frequent inspections for the type of equipment being used.
2. The lifting and supporting shall be made under controlled conditions and under the direction of a designated leader. A qualified signaler shall be appointed.
3. Prior to each working shift, the personnel lift platform and rigging shall be inspected.
4. Communications between the crane operator, signaler, and persons being lifted shall be maintained throughout the lift.
5. The employees being hoisted, moved, or positioned shall remain in continuous sight of, and in direct communication with, the operator or signaler. In situations where direct visual contact with the operator is not possible and the use of a signaler would create a hazard for that person, direct communication alone (such as two-way radio) may be used.
6. Tag lines shall be used unless their use creates an unsafe condition.
7. The crane shall be operated so that lowering will be power-controlled (no free-fall).
8. When welding is done by personnel from the platform or basket, the electrode holders shall be protected from contact with metal components of the personnel platform or basket.
9. Employees working from a platform shall wear body belts/harnesses with lanyards attached to the lower load block or overhaul ball, or to a structural member within the platform that is capable of supporting a fall impact. When working above water, the requirements of 29 CFR 1926.106 (Occupational Safety and Health Regulations for Construction) shall also apply.

10. The operator shall remain at the controls when the personnel platform is occupied.

11. Movement of the personnel platform shall be done in a slow, controlled, cautious manner with no sudden movements of it or the crane. The lifting or lowering speed shall not exceed 100 ft/min (30 m/min).

12. The total weight of the lifted load (including personnel) shall not exceed 50 percent of the crane rating under the planned conditions of use.

13. Suspended personnel platforms shall be used only for personnel, their tools, and sufficient materials to do their work. They should not be used for transporting bulk materials.

14. Personnel shall keep all parts of their bodies inside the suspended personnel platform during raising, lowering, and positioning to avoid pinch points. Personnel shall not stand on or work from the top rail, midrail, or toeboard of the suspended personnel platform.

15. If the personnel platform cannot be landed, it should be tied to the structure before personnel get off or on.

16. Personnel platforms should not be used in winds greater than 15 mph (25 km/h), electric storms, snow, ice, sleet, or other adverse weather conditions that could affect the safety of personnel.

17. After the personnel platform is positioned, all brakes and locks on the lift crane shall be set before personnel perform any work.

18. No lifts shall be made on another of the crane’s load lines while personnel are suspended on a platform.

19. Cranes and derricks with variable-angle booms shall be equipped with a boom-angle indicator that is readily visible to the operator.

20. Cranes with telescoping booms shall be equipped with a device to indicate clearly to the operator, at all times, the boom’s extended length, or an accurate determination of the load radius to be used during the lift shall be made prior to hoisting personnel.

21. A positive-acting device shall be used that prevents contact between the load block or overhaul ball and the boom tip (anti-two-blocking device), or a system shall be used that deactivates the hoisting action before damage occurs in the event of a two-blocking situation (two-block damage-prevention feature).

22. The crane shall be uniformly level within 1 percent of level grade and located on firm footing.

23. Cranes shall not travel while personnel are on a personnel platform or in the basket.

24. Cranes with outriggers shall have the outriggers fully extended and blocked.

15.5.3 Forklift Trucks

a. Know the rated capacity of the forklift and always operate within that capacity. Since the load rating for forklifts may be based on stability or hydraulic/structural competence, the rated capacity shall not be exceeded in operational application. Signs of tipping shall never be used to determine if a load is within the forklift’s capacity.

b. Attachments almost always affect rated capacity of the truck. When a forklift truck is equipped with an attachment, the rated capacity of the truck/attachment combination shall be established by the truck manufacturer. Capacity, operation, and maintenance instruction plates, tags, or decals shall be changed accordingly.

1. The rated capacity of an attachment/truck combination shall not be exceeded.

2. On every removable attachment (excluding fork extensions), a corrosion-resistant nameplate with the following information is required:
   
i. Model number
ii. Serial number on hydraulically actuated attachments

iii. Maximum hydraulic pressure (on hydraulically actuated attachments)

iv. Weight

v. Capacity

vi. The following instructions (or equivalent); "Capacity of truck and attachment combination may be less than capacity shown on attachment. Consult truck nameplate."

NOTE: The above information should be provided by the attachment manufacturer.

c. Modifications or additions that affect capacity or safe operation shall not be performed without prior written approval from the forklift truck manufacturer. Capacity, operation, and maintenance instruction plates, tags, or decals shall be changed accordingly.

d. Ensure that battery recharging and maintenance takes place in designated areas where smoking, sparks, or open flames are prohibited. Verify the location and operability of eyewash and shower facilities before maintenance is performed. Wear eye protection, rubber gloves, and rubber aprons. Whenever battery maintenance is performed, any area of the body affected by contact with battery electrolyte shall be flushed with water immediately and all acid spills must be cleaned up at once.

e. Ensure that fueling of internal-combustion-powered forklift trucks takes place in designated areas. The vehicle engine must be turned off and smoking, sparks, or open flames shall be prohibited.

f. Handling liquefied petroleum gas (LPG) fuel presents a unique hazard. Therefore, to avoid injury while refueling with LPG fuel, precisely follow the refueling procedure in the operator's manual for the vehicle.

g. The operation of internal combustion-powered forklift trucks in confined spaces shall be prohibited unless special precautions are followed to preclude the buildup of carbon monoxide gas above prescribed levels.

h. Only qualified operators shall be permitted to operate forklift trucks. No one shall operate the equipment other than the person to whom it is assigned.

i. Report and correct any apparent mechanical deficiencies before operating the forklift truck.

15.5.3.1 Operating the Unit

The following requirements shall be observed by the operator when operating forklift trucks.

15.5.3.1.1 General

a. Safe operation is the responsibility of the operator. Report all accidents and "near misses" promptly.

b. The operator shall develop safe working habits and also be aware of hazardous conditions in order to protect himself, other personnel, the truck, and other material.

c. The operator shall be familiar with the operation and function of all controls and instruments before operating the truck.

d. Before operating any truck, the operator shall be familiar with unusual operating conditions which may require additional safety precautions or special operating instructions.

e. Be certain the truck has successfully passed a preuse inspection. A sample Pre-operational inspection checklist is included as Exhibit 1, which appears at the end of this chapter.

f. Do not start or operate the truck, any of its functions or attachments, from any place other than from the designated operator’s position.

g. Keep hands and feet inside the operator’s designated area or compartment. Do not put any part of the body outside the operator compartment of the truck.

h. Never put any part of the body within the reach mechanism of the truck or other attachments.

i. Avoid reaching through the mast for any purpose.

j. To safeguard pedestrians, understand the truck’s limitations and observe the following precautions:
1. Do not drive a truck up to anyone standing in front of an object.

2. Ensure that personnel stand clear of the rear swing area before conducting turning maneuvers.

3. Exercise particular care at cross aisles, doorways, and other locations where pedestrians may step into the path of travel of the truck.

4. Do not allow anyone to stand or pass under the elevated portion of any truck, whether empty or loaded.

k. Do not permit passengers to ride on powered industrial trucks unless a safe place to ride has been provided by the manufacturer.

l. Ensure that fire aisles, access to stairways, and fire equipments is kept clear.

m. A powered industrial truck is considered unattended when the operator is more than 25 ft. (7.6m) from the truck, which remains in his view, or whenever the operator leaves the truck and it is not in his view.

n. Before leaving the operator’s position the operator shall perform the following:
   1. Bring truck to a complete stop.
   2. Place directional controls in neutral.
   3. Apply the parking brake.
   4. Fully lower load-engaging means, unless supporting an elevated platform.

o. In addition, when leaving the truck unattended the operator shall perform the following:
   1. Stop the engine or turn off the controls.
   2. If the truck must be left on an incline, block the wheels.
   3. Fully lower the load-engaging means.

p. Maintain a safe distance from the edge of ramps, platforms, and other similar working surfaces. Do not move railroad cars with a powered industrial truck.

q. Do not use a truck for operating or closing railroad car doors except as follows:
   1. Unless the truck utilizes a device specifically designed for opening and closing railroad car doors and the operator is trained in its use.
   2. The design of the door-opening device shall require the truck to travel parallel to the railroad car, with the force applied in a direction parallel with the door travel.
   3. Care should be exercised when engaging the railroad car door with the door opening device, in order to prevent damage to the doors and/or fork truck by heavy impact forces.
   4. The entire door opening operation shall be in full view of the operator.
   5. The fork truck shall always be positioned to safeguard the dock attendant while removing the door lock pin.
   6. Whenever a railroad car door requires an abnormal force to open, the truck operator shall report the condition to his supervisor.

r. Wheel stops, hand brakes, or other recognized positive protection shall be provided to prevent railroad cars from moving during loading or unloading operations.

s. Consider both the truck and load weight when operating in railcars and semitrailers.

t. Inspect floors on trucks, boxcars, unfamiliar ramps, or platforms before start of operation.

u. Other workers should not be inside the truck when the forklift truck is performing loading or unloading operations. Load arrangements and spacing issues should be determined before the forklift enters the truck.

v. Fixed jacks or supports may be needed to prevent upending or corner dipping when powered industrial trucks are driven on and off semitrailers that are not coupled to the tractor.

w. The brakes of highway trucks shall be set and wheel chocks placed under the rear wheels to prevent the trucks from rolling while they are boarded.
x. Care shall be taken to not contact overhead installations such as lights, wiring, pipes, sprinkler systems, etc. If in doubt, measure.

y. Motorized hand trucks shall not be ridden unless they are of the hand/rider design.

15.5.3.1.2 Traveling

a. Observe all traffic regulations and under all travel conditions, operate the truck at a speed that will permit it to be brought to a stop in a safe manner. Unless facility-specific procedures state otherwise, the guideline is: within plant buildings - 5 mph; on plant roads - 15 mph. Drive slowly around curves.

b. Yield the right of way to pedestrians and emergency vehicles. Whenever possible, establish eye contact with approaching pedestrians or vehicle drivers before continuing.

c. Do not pass another truck traveling in the same direction at intersections, blind spots, or at other locations where vision is obstructed.

d. Slow down and sound horn at cross aisles and other locations where vision is obstructed.

e. Railroad tracks shall be crossed diagonally whenever possible.

f. Never travel with forks raised to unnecessary heights. Approximately 4 to 6 inches (10 to 15 cm) above floor level is adequate.

g. Do not park closer than 6 ft (1800 mm) to the nearest rail or a railroad track.

h. Face in the direction of travel, except if the load being carried obstructs forward view. In such cases travel with the load trailing.

i. When ascending or descending grades, ramps, and inclines:
   1. In excess of 5 percent grade, drive loaded rider trucks with the load upgrade.
   3. Use low gear or slowest speed control.
   4. Operate unloaded trucks with the load-engaging means downgrade.
   5. The load and load-engaging means shall be tilted back, if applicable and raised only as far as necessary to clear the road surface.

   6. Avoid turning if possible, and normally travel straight up and down.

   j. While turning, be cautious of rear end swing and keep clear of the edge of loading docks.

   k. Make starts, stops, turns, or direction reversals in a smooth manner so as not to shift load and/or overturn the truck.

   l. Do not indulge in stunt driving or horseplay.

   m. Slow down for wet and slippery floors.

   n. Before driving over a dockboard or bridge plate, be sure that it is properly secured.

   o. Drive carefully and slowly across the dockboard or bridge plate, and never exceed its rated capacity.

   p. Do not drive trucks onto any elevator unless specifically authorized to do so. In cases operation are authorized:

      1. Do not exceed the capacity of the elevator.

      2. Approach elevators slowly, and then enter squarely after the elevator car is properly leveled.

      3. Once on the elevator, neutralize the controls, shut off the power, and set brakes.

      4. It is advisable that all other personnel leave the elevator before truck is allowed to enter or leave.

   q. Unless a towing hitch is supplied by the manufacturer, do not use forklift trucks as tow trucks. When a towing hitch is provided, use tow bars rather than wire rope for towing.

   r. At the end of the operator's shift, return the forklift truck to its assigned parking place, set brakes, fully lower load-engaging means, place controls in neutral position, turn ignition off, and secure the key.

   s. If the truck is equipped with a seat belt, use it.
15.5.3.1.3 Loading

a. Since the load rating for forklifts may be based on stability or hydraulic or structural competence, do not exceed the rated capacity in operational application.

b. The designated person shall ensure that the weight of a load approaching the rated capacity (combination of weight and location of the center of gravity) has been determined within -10 percent, +0 percent before it is lifted.

c. Only stable, safely arranged loads shall be handled. Block and secure them if necessary.

d. Caution shall be exercised when handling off-center loads which cannot be centered.

e. Always spread the forks to suit the load width.

f. Extra caution is required when handling loads exceeding the dimensions used to establish truck capacity. Stability and maneuverability may be adversely affected.

g. The forks shall be placed under the load as far as possible; the mast shall be carefully tilted backward to stabilize the load.

h. Do not transport loads or miscellaneous items within the operator's compartment or other areas of the truck, unless a secure area has been provided and designated by the user.

i. A load backrest extension shall be used whenever necessary to minimize the possibility of the load or part of it from falling rearward.

j. Do not attach or operate any attachment on a forklift truck that has not been approved for use by the forklift truck manufacturer.

k. When attachments are used, extra care shall be taken in securing, manipulating, positioning, and transporting the load.

l. Operate trucks equipped with attachments as partially loaded trucks when not handling a load.

m. Fork length should be at least two thirds of the load length.

n. Use extreme care when tilting load forward or backward, particularly when high tiering.

o. Do not tilt forward with forks elevated except to pick up or deposit a load over a rack or stack.

p. When stacking or tiering, use only enough backward tilt to stabilize the load.

q. Do not rig loads from the tines of a forklift truck, (attaching rigging to the forks to support a suspended load) without written management approval.

r. Never lift with one fork without an engineering analysis and approval.

s. Use guides and signalers as necessary. If in doubt, check the conditions personally before proceeding. Standard hand signals are shown in Figure 15.17 "Hand Signals."

t. Do not block fire extinguishers, fire protection sprinklers, or alarm stations when stacking loads.

15.5.3.2 Ordinary Lifts

a. An appointed person shall classify each lift into one of the DOE categories (ordinary or critical) before the lift is planned.

b. Hoisting and rigging operations for ordinary lifts require a designated leader who shall be present at the lift site during the entire lifting operation. If the lift is being made by only one person, that person assumes all responsibilities of the designated leader.

c. Leadership designation may be by written instructions, specific verbal instructions for the particular job, or clearly defined responsibilities within the crew's organizational structure.

d. The designated leader's responsibility shall include the following:

1. Ensure that personnel involved understand how the lift is to be made.
RAISE THE TINES. With forearm vertical, forefinger pointing up, move hand in small horizontal circle.

LOWER THE TINES. With arm extended, palm down, lower arm vertically.

TILT MAST BACK. With forearm vertical, thumb extended, jerk thumb over shoulder.

TILT MAST FORWARD. With arm extended, thumb down, lower arm vertically.

MOVE TINES IN DIRECTION FINGER POINTS. With arm extended, palm down, point forefinger in direction of movement.

DOG EVERYTHING. Clasp hands in front of body.

STOP. Extend both arms, palms down.

Figure 15-17. Standard hand signals for controlling forklift operation.
2. Ensure that the weight of the load is determined, that proper equipment and accessories are selected, and that rated capacity is not exceeded.

3. Survey the lift site for hazardous/unsafe conditions.

4. Ensure that equipment is properly set up and positioned.

5. Ensure that a signaler is assigned, if required, and is identified to the operator.

6. Direct the lifting operation to ensure that the lift is completed safely and efficiently.

7. Stop the job when any potentially unsafe condition is recognized.

8. Direct operations if an accident or injury occurs.

15.5.3.3 Critical Lifts

a. The operating organization shall appoint one PIC of the lifting operation. This person shall meet the definitions of appointed, designated, and qualified, as described in Section 15.2, “Definitions.”

b. The PIC shall ensure that a pre-job plan is prepared that defines the operation and shall include the following:

   1. Identification of the items to be moved, the weight, dimensions, center of gravity, and the presence of hazardous or toxic materials.

   2. Identification of forklifts to be used by type and rated capacity.

   3. Rigging sketches that include (as applicable):

      i. Identification and rated slings, lifting bars, rigging accessories, and below-the-hook lifting devices.

      ii. Load-indicating devices.

      iii. Load vectors.

      iv. Lifting points.

      v. Sling angles.

   vi. Boom and swing angles.

   vii. Methods of attachment.

   viii. Forklift orientations.

   ix. Other factors affecting equipment capacity.

4. Operating procedures and special instructions to operators including rigging precautions and safety measures to be followed as applicable.

c. Only experienced operators who have been trained and qualified to operate the specific equipment to be used shall be assigned to make the lift.

d. Only designated, qualified signalers shall give signals to the operator. **However, obey STOP signal at all times no matter who gives the signal.**

e. The responsible manager or designee shall review and approve the procedure and rigging sketches before the lift is made.

15.5.3.4 Lifting of Personnel

If a work platform is used on forklift trucks designed and intended for handling materials, take the following precautions:

a. Use a lift platform manufactured for the purpose of lifting personnel with a forklift truck. The platform shall include:

   1. A 4-in. (10-cm) minimum height toe plate provided on the work platform.

   2. The floor of the platform located not more than 8-in (20-cm) above the upper face of the supporting truck fork blade.

   3. A restraining means such as a guard rail having a height above the platform floor of not less than 36 in. (90-cm) or more than 42 in. (110-cm) around its upper periphery and including a midrail.

   4. An access opening in the guard rail maybe hinged or removable, or chains may be used if proper positioning is easily accomplished and a secured condition is discernible.

   5. Guard rails and access openings shall
be capable of withstanding a concentrated force of 200 lb (91 kg) in any direction.

6. Means to securely attach the platform to the lifting carriage or forks in such a manner that it cannot slide or bounce off the forks.

7. Means to correctly locate the platform centered laterally on the truck.

8. Floor dimensions that neither exceed two times the load center distance listed on the truck nameplate, measured parallel to the longitudinal center plane of the truck, nor have a width greater than the overall width of the truck (measured across the load bearing tires) plus 10 in. (25-cm) on either side.

9. The following information should be prominently indicated on the platform:
   i. maximum load including personnel and equipment;
   ii. weight of empty platform;
   iii. minimum capacity of the truck on which the platform can be used.

b. The combined weight of the platform, load, and personnel shall not exceed one-half of the capacity as indicated on the nameplate of the truck on which the platform is used.

c. Whenever a truck (except for high-lift order-picker trucks) is equipped with vertical hoisting controls elevateable with the lifting carriage or forks, take the following additional precautions to protect personnel:

1. Means shall be provided whereby personnel on the platform can shut off power to the truck.

2. Means shall be provided to render inoperative all operating controls on the elevating platform, when the controls on the elevating platform have been selected for use; only one location of controls shall be capable of being operated at one time.

3. Emergency-lowering means available at ground level should be provided; such means shall be protected against misuse.

d. Take the following precautions whenever personnel are elevated with a forklift truck:

1. Ensure the truck has a firm and level footing.

2. Place all travel controls in neutral and set parking brake.

3. Before elevating personnel, mark area with cones or other devices to warn of work by elevated personnel.

4. Lift and lower personnel smoothly, with caution, and only at their request.

5. Avoid overhead obstructions and electric wires.

6. Keep hands and feet clear of controls other than those in use.

7. Move truck and/or platform slowly, only for minor adjustments in horizontal positioning when personnel are on the platform, and only at their request.

8. Ensure the mast is vertical - do not operate on a side slope.

9. The platform is horizontal and never tilted forward or rearward when elevated.

10. Personnel are to remain on the platform floor. The use of railings, planks, ladders, etc., on the platform for the purpose of achieving additional reach or height is prohibited.

11. Ensure personnel and equipment on the platform do not exceed the available space.

12. Lower platform to floor level for personnel to enter and exit. Do not climb on any part of the truck in attempting to enter or exit.

13. The operator shall remain in the control position of the forklift truck.

14. Be certain that the lifting mechanism is operating smoothly throughout its entire lift height, both empty and loaded, and that lift limiting devices and latches, if provided, are functional.

15. Means shall be provided to protect
personnel from moving parts of the forklift truck that present a hazard when the personnel platform is in the normal working position.

16. Overhead protection, as necessary for operating conditions, shall be provided.

17. Do not transport personnel from one location to another while they are on the work platform.

18. When not in the operating position, engage the parking brake and block the wheels.

19. Be certain that required restraining means such as railings, chains, cable, body belts with lanyards, or deceleration devices, etc., are in place and properly used.

UL 558, Internal-Combustion-Engine-Powered Industrial Trucks.

UL 583, Electric-Battery-Powered Industrial Trucks.
APPENDIX A
PROCUREMENT GUIDELINES

This appendix provides guidance in preparing purchase requisitions for hoisting and rigging materials and equipment. Nationally recognized standards and specifications are referenced for listed items. However, caution should be used prior to procurement of special items in order to verify appropriate specification or standard reference and requirements. Some specific requirements listed in this appendix are more restrictive than consensus standard requirements, but are recommended to ensure materials of adequate quality and workmanship are provided.

Quality receipt inspections should be provided for all received materials in order to verify compliance of all requirements stated on the purchase order.

This appendix primarily contains procurement criteria for off-the-shelf type items. If the information provided in this appendix is used in the development of specifications for purchase of cranes or other special handling equipment, the appropriate engineering group should be consulted.

Since this appendix contains only a partial listing of commonly used rigging hardware, the requisitioner shall review applicable standards or specifications and identify requirements to which the manufacturer shall adhere.

More specific information or requirements may be obtained by consulting the applicable section of this manual or an equipment manufacturer.

The manufacturer shall provide requested documentation as appropriate (e.g., rated load certification, proof-load test certification, material certification). The documentation shall be signed by the manufacturer's authorized representative.

16.1 TURNBUCKLES - Type III Rigging ................................. A-17
1.1 MANUAL, ELECTRIC AND AIR OPERATED HOISTS

a. Suggested requirements include but are not limited to the following:

1. Manual, electric and air operated hoists shall meet or exceed the requirements of ASME/ANSI B30.16.

2. The rated load shall be marked on the hoist or load block.

3. Shall be marked with identification as follows:

   A) Hand Chain Operated
      1) Name of manufacturer
      2) Manufacturer’s model or serial number

   B) Electric-Powered Hoist
      1) Name of manufacturer
      2) Manufacturer’s model or serial number
      3) Voltage of AC or DC power supply and phase and frequency of AC power supply.
      4) Circuit ampacity

   C) Air Powered Hoist
      1) Name of manufacturer
      2) Manufacturer’s model and serial number
      3) Rated air pressure

b. All manual, electric, or air operated hoists shall have affixed to the hoist or load block a label or labels displaying precautionary information concerning operating procedures.

c. Load sprockets shall have teeth or pockets to allow engagement of the load chain, shall be guarded, and provisions shall be made to guard against jamming of the load chain within the hoist mechanism under normal operating conditions.

d. Manufacturer shall supply instruction manual for each hoist, the manual shall include the following information and instructions:

1. Installation
2. Operation
3. Inspection and Testing
4. Lubrication, maintenance, and repair
5. Wiring diagram (electric powered only; maybe supplied separately)

1.1.1 Load Chain

a. Load chain may be either roller or welded link chain.

b. Load chain shall be pitched so as to pass over all load sprockets without binding.

c. Load chain shall be proof tested by the chain or hoist manufacturer with a load test of 1-1/2 times the hoist rated load divided by the number of chain parts supporting the load.

1.1.2 Hoist Hooks

If hooks are of the swiveling type, they should rotate freely. Hooks shall be equipped with latches unless the application makes the use of the latch impractical. When required, a latch shall be provided to bridge the throat opening of the hook and retain, under slack conditions such items as, but not limited to slings, chains, etc. Refer to ASME/ANSI B 30.10.

1.1.3 Load Blocks

a. On hand chain operated hoists, a means shall be provided to guard against load chain jamming in the load block under normal operating conditions.

b. On electric- or air-powered hoists, load blocks shall be of the enclosed type, and means
shall be provided to guard against rope or load chain jamming in the load block under normal operating conditions.

1.1.4 Hoist Brakes

a. Hand chain operated hoist(s) shall be so designed that, when the actuating force is removed, it will automatically stop and hold any test load up to 125% of the rated load.

b. Electric-powered hoist, under normal operating conditions with rated load and test conditions with test loads up to 125% of rated load, the braking system shall perform the following functions:

1. stop and hold the load hook when controls are released;
2. limit the speed of load during lowering, with or without power, to a maximum speed of 120% of rated lowering speed for the load being handled;
3. stop and hold the load hook in the event of a complete power failure.

c. The braking system shall have thermal capacity for the frequency of operation required by the service.

d. The braking system shall have provision for adjustments where necessary to compensate for wear.

e. Air-powered hoist, under normal operating conditions with rated load and test conditions with test loads up to 125% of rated load, the braking system shall perform the following functions:

1. Stop and hold the load hook when controls are released;
2. prevent an uncontrolled lowering of the load in the event of a loss of air pressure
3. The braking system shall have thermal capacity for the frequency of operation required by the service.
4. The braking system shall have provision for adjustments where necessary to compensate for wear.
2.1 MANUALLY OPERATED LEVER HOIST

a. Suggested requirements include but are not limited to the following:

1. Manually operated lever hoists shall meet or exceed the requirements of ASME/ANSI B30.21.

2. Shall have the rated load marked on the hoist or load block

3. Shall be tested by the manufacturer with a test load of at least 125% of the rated load

4. Shall have identifications for controls to indicate function or direction of motion.

5. Shall be marked with identification as follows

   A) Name of Manufacturer

   B) Manufacturer's model or serial number

6. Shall have affixed to the hoist or load block in a readable position, a label or labels displaying precautionary information concerning operating procedures.

2.1.1 Construction

Load sprockets shall have pockets or teeth to allow engagement of the load chain, shall be guarded, and provisions shall be made to guard against jamming of the load chain with the hoist mechanism under normal operating conditions.

2.1.2 Load Chain

a. Load chain may be either roller or welded link type and shall be pitched so as to pass over all sprockets without binding.

b. Load chain shall be proof tested by the chain or hoist manufacturer with a load test of 1-1/2 times the hoist rated load divided by the number of chain parts supporting the load.

c. If a load is supported by more than one part of load chain, the tension on the parts shall be equalized.

2.1.3 Load Blocks

Shall have means to guard against load chain jamming in the load block under normal operating conditions.

2.1.4 Load Controlling Mechanism

a. Shall be equipped with a load controlling mechanism, which shall perform the following functions under normal operating conditions with test loads up to 125% of the rated load.

   1. Stop and hold the load when the lever force is removed and the lever stroke completed.

   2. Provide for incidental movement of the load when lifting or lowering.

   3. Friction brake shall have provision for adjustment where necessary to compensate for wear

a. Manufacturer shall supply instruction manual for each hoist, the manual shall include the following information and instructions:

   1. Operation

   2. Inspection and Testing

   3. Lubrication, maintenance, and repair
3.1 SHOP/FLOOR CRANES

a. Suggested requirements include but are not limited to the following:

1. Shall meet or exceed the requirements of ASME PALD-1993.

2. Operating controls shall be designed in such a manner that they are readily visible and accessible to the operator and so that the operator will not be subjected to pinch points, sharp edges, or snagging hazards. The operation of controls should be clear to the operator either by position, function, labeling or combination thereof.

3. The release system shall require intentional positive action by the operator for release to prevent accidental lowering.

4. Shall have a positive means to prevent the load from being lowered or raised beyond the design limit of travel.

5. Shop/floor cranes not equipped with internal load limit devices shall be capable of performing a proof test of 150% of the rated capacity.

6. Shop cranes equipped with internal load limiting devices shall, when the load limiting device is deactivated, be capable of performing a proof load test of 125% of rated capacity.

7. Because of the potential hazards associated with the misuse of equipment of this type, no alterations shall be made to the product.

8. Shop/floor cranes shall be provided with a load hook and/or chain at the end of the boom extension, that has a capacity capable of sustaining the proof load of the unit. The load hook shall be provided with a latching mechanism.

9. Shall have required product warnings and markings.
4.1 BELOW THE HOOK STRUCTURAL AND MECHANICAL LIFTING DEVICES

a. Suggested requirements include but are not limited to the following:

   NOTE: Special lifting devices for shipping containers weighing 10,000 lbs or more that are used for radioactive materials maybe governed by ANSI N14.6 (Standard for Shipping Containers Weighing 10,000 Pounds or More for Nuclear Materials).

2. Shall have the rated load capacity marked on the main structure where it is visible. If the lifter is made up of several lifters, each detachable from the group, these lifters shall also be marked with their individual rated loads.

3. A load test, not to exceed 125% of the rated load unless otherwise recommended by a manufacturer shall be provided.

4. A load test certificate indicating the date of load test, amount of load applied, and confirmation of lifter load rating shall be supplied.

5. Rated load should not be more than 80% of the maximum load sustained during the test.

6. Shall have a complete or other permanent marking affixed to the lifter displaying the following:
   A) Manufacturer's Name
   B) Serial Number/Identification Number
   C) Lifter Weight if over 100 lbs. (45KG)
   D) Rated load Capacity

4.1.1 General Construction

a. Shall be designed to withstand the forces imposed by the rated load.

b. Shall have a minimum design factor of 3 based on yield strength for all load bearing structural components.

c. Welding shall be in accordance with ANSI/AWS D1.

d. Guards for exposed moving parts such as, but not limited to gearing, projecting shafts, and chain drives that constitute a hazard under normal operating conditions should be guarded.

e. Electrical equipment and wiring shall comply with Article 610 of ANSI/NFPA 70.
5.1 WIRE ROPE

a. Suggested requirements include but are not limited to the following:

b. Wire rope shall meet or exceed the requirements of Federal Specification RR-W-410D or Mil Specification MIL-2-83420.

c. Wire rope shall be made in the United States by a member of the Wire Rope Technical Board\(^1\) (except stainless steel, and unless recommended otherwise by a crane or hoist manufacturer). Stainless steel wire rope shall be made in the United States and shall be 302 or 304 grade stainless steel unless otherwise recommended by a crane or hoist manufacturer.

d. Wire rope shall have documentation from the manufacturer traceable to the material furnished and signed by the manufacturer's authorized representative. Documentation should reference as a minimum the purchase order number, the diameter, number of strands, core, lay, grade, manufacturer's lot/run number, material number and the nominal breaking strength of a sample.

e. Shall be shipped lubricated and with a protective covering, i.e. plastic or cardboard.

---

Note: This list is not all inclusive and may not include subsidiary companies.
6.1 CHAIN SLINGS

a. Suggested requirements include but are not limited to the following:

2. Alloy steel chain slings shall have permanently affixed durable identification stating size, manufacturer's grade, rated load and angle upon which the rating is based, reach, number of legs, and sling manufacturer.

3. Hooks, rings, oblong links, pear-shaped links, welded or mechanical coupling links or other attachments shall have a rated load of at least equal to that of alloy steel chain with which they are used.

4. All welded components in the sling assembly shall be proof load tested as components or as part of the sling assembly.

5. Hooks attached to chain slings shall meet the requirements of ASME/ANSI B30.10.

6. The welded components of all new slings shall be proof tested by the component or sling manufacturer to twice the rated load.

7. The proof load for multiple leg slings shall be applied to the individual legs and shall be twice the rated load of a single leg sling.

8. A certificate of proof test shall be provided by the manufacturer or supplier referencing the specific sling identification number, date of test, and amount of load applied. (Employer shall retain a certificate of the proof test and shall make it available for examination.)
7.1 SYNTHETIC SLINGS

a. Suggested requirements include but are not limited to the following:

2. Should be manufactured from webbing specifically constructed for overhead lifting, featuring red core yarns.

3. Webbing shall have the following characteristics:
   A) sufficient certified tensile strength to meet the sling manufacturer's requirements;
   B) uniform thickness and width;
   C) full woven width, including selvage edges;
   D) webbing ends shall be sealed by heat, or other suitable means, to prevent raveling.

4. Thread used in the manufacture of synthetic web slings shall be the same generic type yarn as the webbing.

5. Stitches shall be lock-stitched and preferably continuous. When not continuous, it shall be back stitched at the ends to prevent raveling.

6. The load carrying splice shall be sewn with a pattern of sufficient strength to justify the manufacturer's rated capacities.

7. Shall have a minimum design factor of 5.

8. End fittings shall have sufficient strength to sustain twice the rated load of the sling without permanent deformation.

EACH SLING SHALL BE PERMANENTLY MARKED WITH THE FOLLOWING:

A) Manufacturer's name or trademark.

B) Manufacturer's code or stock number.

C) Type of synthetic web material.

D) Rated loads for the type of hitches used.

NOTE: Hand written, or ink embossed markings are not acceptable.

9. The manufacturer shall have on file a written system of sling traceability as well as a quality control procedure. Traceability should be specific mill lots.

10. Fabric wear pads should be sewn into the bearing points of the sling eye's. Leather wear pads are not recommended.

11. Product warnings relative to the proper use, care, and maintenance shall accompany the shipment.

12. Single leg and endless synthetic-web slings shall be proof tested to 200% of the rated load.

13. Multiple leg bridle slings shall have the proof load applied to the individual legs. The proof load shall be two times the vertical rated load of a single leg sling.

14. A load test certificate (LTC) shall be provided for each lot of slings supplied. The LTC shall reference as a minimum the PO number, date of proof test, amount of load applied, sling capacity, and lot/run number. The LTC shall be signed by the manufacturers authorized representative.
8.1 SYNTHETIC POLYESTER ROUND SLINGS

a. Suggested requirements include but are not limited to the following:

1. Slings should meet or exceed requirements of the Web Sling and Tiedown Association, Inc., recommended specification for round slings made of polyester fibers used for general lifting purposes.

2. Polyester round slings including those incorporating welded fittings shall be proof tested to two (2) times the rated capacity.

3. A load test certificate (LTC) shall be provided for each lot of slings supplied. The LTC shall reference the minimum the PO number, date of proof test, amount of load applied, sling capacity and lot/run number. The LTC shall be signed by the manufacturer's authorized representative.

4. The core(s) shall be formed from one or more ends of yarn, wound together on a plurality of turns. The core(s) should be uniformly wound to ensure even distribution of the load.

5. The cover(s) should be of the same fiber type as the load bearing core(s). When the cover is a different fiber type than the load bearing core, follow the manufacturer’s recommendations for use.

6. The cover should be made from one length of material.

7. When the core and cover are of the same fiber, the thread shall also be of that fiber type. When the core and cover are of different fiber types, the thread should be of the same fiber type as the cover.

8. All stitching shall be lock-stitched type and should be continuous. When not continuous, they shall be back stitched or overstitched to prevent raveling.

9. The design factor for new polyester round slings and polyester round slings incorporating fittings shall be a minimum of five (5).

10. Each polyester round sling shall be permanently marked or labeled showing:

   A) Name or trademark of manufacturer.
   B) Manufacturer’s code or stock number.
   C) Rated capacities for the three basic hitches. (vertical, choker, vertical basket)
   D) Core fiber type - if cover(s) is of a different fiber type, both fiber types shall be identified.
   E) Length (reach) - bearing point to bearing point.

11. Each manufacturer shall internally identify their product with name or trademark for traceability.
9.1 WIRE ROPE SLINGS

a. Suggested requirements include but are not limited to the following:

2. Wire rope purchased to fabricate slings shall be made in the United States by a member of Wire Rope Technical Board (Except stainless steel). Stainless steel wire rope shall be made in the United States and shall be 302 or 304 Grade stainless steel.

4. Wire rope shall have documentation from the manufacturer traceable to the material furnished and signed by the manufacturer's authorized representative. Documentation shall reference as a minimum the PO number, the diameter, number of strands, core, lay, grade, manufacturing lot/run number, master reel number and nominal breaking strength of sample.

5. Shall be shipped lubricated and with a protective covering, i.e. plastic or cardboard.

6. Slings should be either 6 x 19 or 6 x 37 classification.

7. Slings should be made of wire rope produced from EXIPS (Extra Improved Plow Steel) with an IWRC (Independent Wire Rope Center). Consideration may be given to other grades or types of wire rope, dependent upon the type of expected service due to the type of load, hitch, or environment.

8. Shall have a minimum of 5 to 1 safety factor.

9. Mechanical spliced single leg and endless wire rope slings and swaged socket or poured socket assemblies shall be load tested to two times the rated vertical load.

10. Shall be individually tagged with a durable tag including the following information:

A) WLL (Working Load Limit)
B) Purchase order number or serial number
C) Manufacturer’s name or ID

11. Shall have a load test certificate (LTC) for each lot of slings supplied. The LTC shall reference as a minimum the PO number, date of proof test, amount of load applied, sling capacity, & lot/run number, LTC shall be signed by the manufacturer’s authorized representative.

12. Single leg hand tucked slings shall have a proof load equal to the rated load but shall not exceed 125% of the rated load.

13. The proof load for multiple leg bridle slings shall be applied to the individual legs and shall be either 1.25 for hand tucked splice or 2 for mechanical splice, times the vertical rated load of a single leg sling of the same size, grade, and construction of rope. Any master link to which multiple leg slings are connected shall be proof loaded to 2 times the force applied by the combined legs.

14. Multiple leg bridle slings shall be tagged with a durable tag on the master link indicating the working load limit for the total combined legs for each individual sling in a vertical configuration. The purchase order number or serial number and the manufacturer’s ID should be supplied.
10.1 WIRE ROPE CLIPS (Clamps)

a. Suggested requirements include but are not limited to the following:

1. Shall meet or exceed requirements of Federal Specification FF-C-450D.

2. Shall be permanently and legibly marked with the size and manufacturer's identifying mark.

3. Wire rope clips should be shipped with application instructions and product warnings for each type or size clip.
11.1 EYE BOLTS

a. Suggested requirements include but are not limited to the following:

1. Shall be fabricated from forged carbon or alloy steel and shall meet or exceed the requirements of ASTM specification A489 for "Carbon Steel Eye Bolts" or ASTM F541 "Standard Specification for Alloy Steel Eyebolts." and ANSI/ASME B18.15 "Forged Eye Bolts".

2. Eye bolts used for lifting service shall have the manufacturer’s name or identification mark forged in raised characters on the surface of the eyebolt. Alloy steel eye bolts shall have the symbol "A" (denoting alloy) and the manufacturer’s name or identification forged in raised letters on the surface of the eyebolt.

3. The safe working load shall have a safety factor of 5.
12.1 HOOKS

a. Suggested requirements include but are not limited to the following:

1. Hooks used for lifting service shall meet or exceed the requirements of ANSI/ASME B30.10.

2. Manufacturer’s identification shall be forged cast, or die stamped on a low stress non-wearing area of the hook.

3. When proof tests are used to verify manufacturing process, material, or configuration, hooks shall be able to withstand proof load application, without permanent deformation when a load is applied for a minimum of 15 seconds. Proof loads for hooks up to 50 ton capacity shall be 200% of rated load.

4. Performance testing of hooks shall not be required except where necessary to conform to requirements for the equipment of which they are a part of.
13.1 SWIVEL HOIST RINGS

a. Suggested requirements include but are not limited to the following:

1. All hoist rings shall be individually proof load tested to a minimum of 2 times the working load limit, but no more than 2 1/2 times.

2. Shall have a proof load certificate supplied from the manufacturer with each swivel hoist ring.

3. Shall have the manufacturer's name or trademark permanently marked on the swivel hoist ring.

4. Shall have a minimum safety factor of 4 based on ultimate breaking strength.

5. Shall be permanently marked by the manufacturer with the WLL and recommended torque value.

6. Shall be packaged with proper application instructions and warning information.
14.1 HOIST RINGS, PEAR SHAPED LINKS

a. Suggested requirements include but are not limited to the following:

   1. Shall meet or exceed the requirements of RR-C-271-D.

   2. Welded rings or links shall be subjected to a nondestructive weld test (NDT) and have documentation provided. Note: NDT is not required for forged rings or links.

   3. Shall have a minimum safety factor of 5 based on ultimate breaking strength.

   4. Rings shall be forged or welded from low alloy steel.

   5. Should be marked by the manufacturer with the manufacturer's name or trademark and ring or link size.
15.1 **SHACKLES**

a. Suggested requirements include but are not limited to the following:

1. Shackles shall meet or exceed the requirements of Federal Specification RR-C-271D.

2. Type of shackles covered by this specification include: Class 1, Round Pin Anchor; Class 2, Screw Pin Anchor; Class 3, Safety Anchor; Class 1, Round Pin Chain; Class 2, Screw Pin Chain; and Class 3, Safety Chain shackles.

3. Each shackle body shall be permanently and legibly marked in raised or stamped letters on the side of the shackle bow with the identifying manufacturer's name or trademark, shackle size, and the recommended safe working load.

   A) Grade A regular strength shackle pins and bolts shall be unmarked;

   B) Grade B high strength shackle pins and bolts shall be marked by the raised or stamped letters "HS" on the head.

   C) Shackles shall have minimum 5 to 1 safety factor.

4. Grade A shackles (Regular Strength), together with their pins and bolts shall be forged from carbon steel. Grade B shackles (High Strength) together with their pins and bolts shall be forged from alloy steel.

5. Shackle samples shall be subjected to proof loads of two times the working load limit.

6. Shackles shall fit freely without binding and seat properly.

8. Shackles shall be sufficiently ductile so that, when fractured, the fractured member shall show a permanent distortion before breaking.
16.1 TURNBUCKLES - Type III Rigging

a. Suggested requirements include but are not limited to the following:

1. Turnbuckles used for rigging applications shall meet or exceed the requirements of Federal Specification FF-T-791B, Section 3.9.3.

2. Shall be fabricated from forged alloy steel.

3. Shall be provided with a jam nut of a type which does not depend upon deformation of the threads for security.

4. Certificate of proof test shall be provided by the manufacturer for selected samples from each lot. Certificate shall indicate as a minimum the size, WLL, test weight, and date of test.

5. Proof test loads shall be one-half the specified breaking strength for the end pull.

6. Turnbuckles shall have a minimum safety factor of 5 based on ultimate breaking strength.

7. Manufacturer's name or trademark and turnbuckle size shall be permanently marked on the body of the turnbuckle.

**Exhibit 1 - Purchase Requisition Example.**
### FUNCTIONAL REQUIREMENTS FOR WIRE ROPE:

Carbon steel wire rope shall be made in the United States by a member of the Wire Rope Technical Board.

Shall meet the requirements of RR-W-410D Federal Specification for Wire Rope and Strand or MIL-W-83420 for aircraft cable.

Shall be shipped lubricated and with a protective covering, i.e. plastic or cardboard.

Wire Rope shall have Documentation from the manufacturer traceable to the material furnished and signed by the manufacturer's authorized representative. Documentation Shall reference as a minimum the PURCHASE ORDER number, state the diameter number of strands, core, lay, grade, manufacturing lot/run number or master reel number and nominal breaking strength of sample.

Acceptance Criteria:

Quality receipt inspection shall verify that the manufacturer is a member of the Wire Rope Technical Board (for carbon steel), verify the diameter, lay, grade, core and documentation as complete and meets or exceeds the requirements of this scope.

### FUNCTIONAL REQUIREMENTS FOR WIRE ROPE SLINGS:

Wire rope purchased to fabricate slings shall be made in the United States by a member of the Wire Rope Technical Board.

Shall meet the requirements of RR-W-410D Federal Specification for Wire Rope and Strand or MIL-W-83420 for aircraft cable.

Wire Rope Shall have Documentation from the manufacturer traceable to the material furnished and signed by the manufacturer's authorized representative. Documentation Shall reference as a minimum the P.O. number, state the diameter, number of strands, core, lay, grade, manufacturing lot/run number, master reel number, and nominal breaking strength of sample.

Shall be shipped lubricated and with a protective covering, i.e. plastic or cardboard.

Shall be mechanical Flemish eye spliced.

Single leg slings Shall be either 6 x 19 or 6 x 37 classification.
